BDgraph-package

Bayesian Structure Learning in Graphical Models

## **Description**

The R package **BDgraph** provides statistical tools for Bayesian structure learning in undirected graphical models for continuous, ordinal/count/dicrete, binary, and mixed data. The package is implemented the recent improvements in the Bayesian graphical models' literature, including Mohammadi and Wit (2015), Mohammadi et al. (2023), Mohammadi et al. (2017), and Dobra and Mohammadi (2018). To speed up the computations, the intensive tasks of the package are implemented in parallel using **OpenMP** in C++ and interfaced with R. Besides, the package contains several functions for simulation and visualization, as well as several multivariate datasets taken from the literature.

adj2link 5

adj2link

Extract links from an adjacency matrix

# Description

Extract links from an adjacency matrix or an object of calsses "sim" from function bdgraph.sim and "graph" from function graph.sim.

# Usage

```
adj2link( adj )
```

# **Arguments**

adj

adjacency matrix corresponding to a graph structure in which  $a_{ij}=1$  if there is a link between notes i and j, otherwise  $a_{ij}=0$ . It can be an object with S3 class "sim" from function bdgraph.sim. It can be an object with S3 class "graph" from function graph.sim.

#### Value

matrix corresponding to the extracted links from graph structure.

## **Examples**

```
# Generating a 'random' graph
adj <- graph.sim( p = 6, vis = TRUE )
adj2link( adj )</pre>
```

auc

Compute the area under the ROC curve

# Description

This function computes the numeric value of area under the ROC curve (AUC) specifically for graph structure learning.

# Usage

```
auc( pred, actual, cut = 200, calibrate = TRUE )
```

## **Arguments**

pred adjacency matrix corresponding to an estimated graph. It can be an object with

S3 class "bdgraph" from function bdgraph. It can be an object of S3 class

"ssgraph", from the function ssgraph::ssgraph() of R package ssgraph::ssgraph().

It can be a numeric or ordered vector of the same length than actual, contain-

ing the predicted value of each observation.

actual adjacency matrix corresponding to the actual graph structure in which  $a_{ij}=$ 

1 if there is a link between notes i and j, otherwise  $a_{ij} = 0$ . It can be an object with S3 class "sim" from function bdgraph.sim. It can be an object with S3 class "graph" from function graph.sim. It can be a factor, numeric or character vector of responses (true class), typically encoded with 0 (controls)

and 1 (cases). Only two classes can be used in a ROC curve.

cut number of cut points.

calibrate If TRUE, compute the value of AUC by taking the level of the probabilities into

account.

## Value

The numeric AUC value

bdgraph

Search algorithm in graphical models

# **Description**

As the main function of the **BDgraph** package, this function consists of several MCMC sampling algorithms for Bayesian model determination in undirected graphical models. To speed up the computations, the birth-death MCMC sampling algorithms are implemented in parallel using **OpenMP** in C++.

# Usage

## **Arguments**

data there are two options: (1) an  $(n \times p)$  matrix or a data.frame corresponding

to the data, (2) an  $(p \times p)$  covariance matrix as S = X'X which X is the data matrix (n) is the sample size and p is the number of variables). It also could be an object of class "sim", from function bdgraph.sim. The input matrix is

automatically identified by checking the symmetry.

n number of observations. It is needed if the "data" is a covariance matrix.

method character with two options "ggm" (default) and "gcgm". Option "ggm" is for

Gaussian graphical models based on Gaussianity assumption. Option "gcgm" is for Gaussian copula graphical models for the data that not follow Gaussianity

assumption (e.g. continuous non-Gaussian, count, or mixed dataset).

algorithm character with two options "bdmcmc" (default) and "rjmcmc". Option "bdmcmc"

is based on birth-death MCMC algorithm. Option "rjmcmc" is based on reverible jump MCMC algorithm. Option "bd-dmh" is based on birth-death MCMC algorithm using double Metropolis Hasting. Option "rj-dmh" is based on reveri-

ble jump MCMC algorithm using double Metropolis Hasting.

iter number of iteration for the sampling algorithm.

burnin number of burn-in iteration for the sampling algorithm.

not.cont for the case method = "gcgm", a vector with binary values in which 1 indicates

not continuous variables.

g.prior for determining the prior distribution of each edge in the graph. There are two

options: a single value between 0 and 1 (e.g. 0.5 as a noninformative prior) or

an  $(p \times p)$  matrix with elements between 0 and 1.

df.prior degree of freedom for G-Wishart distribution,  $W_G(b, D)$ , which is a prior distri-

bution of the precision matrix.

g. start corresponds to a starting point of the graph. It could be an  $(p \times p)$  matrix,

"empty" (default), or "full". Option "empty" means the initial graph is an empty graph and "full" means a full graph. It also could be an object with S3 class "bdgraph" of R package BDgraph or the class "ssgraph" of R package ssgraph::ssgraph(); this option can be used to run the sampling algorithm

from the last objects of previous run (see examples).

jump it is only for the BDMCMC algorithm (algorithm = "bdmcmc"). It is for si-

multaneously updating multiple links at the same time to update graph in the

BDMCMC algorithm.

save logical: if FALSE (default), the adjacency matrices are NOT saved. If TRUE,

the adjacency matrices after burn-in are saved.

cores number of cores to use for parallel execution. The case cores = "all" means

all CPU cores to use for parallel execution.

threshold threshold value for the convergence of sampling algorithm from G-Wishart for

the precision matrix.

verbose logical: if TRUE (default), report/print the MCMC running time.

nu prior parameter for option method = "tgm".

#### Value

An object with S3 class "bdgraph" is returned:

p\_links upper triangular matrix which corresponds the estimated posterior probabilities

of all possible links.

K\_hat posterior estimation of the precision matrix.

For the case "save = TRUE" is returned:

sample\_graphs vector of strings which includes the adjacency matrices of visited graphs after

burn-in.

graph\_weights vector which includes the waiting times of visited graphs after burn-in.

all\_graphs vector which includes the identity of the adjacency matrices for all iterations

after burn-in. It is needed for monitoring the convergence of the BD-MCMC

algorithm.

all\_weights vector which includes the waiting times for all iterations after burn-in. It is

needed for monitoring the convergence of the BD-MCMC algorithm.

bdgraph.dw 11

Search algorithm for Gaussian copula graphical models for count data

# **Description**

This function consists of several sampling algorithms for Bayesian structure learning in undirected graphical models for count data. It is based on Gaussian copula graphical models with discrete Weibull distributed marginals. To speed up the computations, the birth-death MCMC sampling algorithms are implemented in parallel using **OpenMP** in C++.

# Usage

```
bdgraph.dw( data, x = NULL, formula = y ~ .,
    n = NULL, algorithm = "bdmcmc", iter = 5000,
    burnin = iter / 2, g.prior = 0.2, df.prior = 3,
    ZI = FALSE, iter_bdw = 5000,
    g.start = "empty", jump = NULL, save = FALSE,
    q = NULL, beta = NULL, pii = NULL,
    cores = NULL, threshold = 1e-8, verbose = TRUE )
```

## **Arguments**

data	$(n \times p)$ matrix or a data.frame corresponding to the data on the p nodes of the graph. It can also be an object of class "sim", from the function <code>bdgraph.sim</code> .
X	$(n \times k)$ matrix or a data.frame corresponding to the predictors.
formula	object of class formula as a symbolic description of the model for linking each node to the predictors. For the case of data.frame, it is taken as the model frame (see model.frame).
n	number of observations. It is needed if the "data" is a covariance matrix.
algorithm	character with two options "bdmcmc" (default) and "rjmcmc". Option "bdmcmc" is based on a birth-death MCMC algorithm. Option "rjmcmc" is based on a reversible jump MCMC algorithm.
iter	number of iterations for the sampling algorithm for graph learning.
burnin	number of burn-in iterations for the sampling algorithm for graph learning.
g.prior	for determining the prior distribution of each edge in the graph. There are two options: a single value between $0$ and $1$ (e.g. $0.5$ as a noninformative prior) or a $(p \times p)$ matrix with elements between $0$ and $1$ .
df.prior	degree of freedom for G-Wishart distribution, $W_G(b,D)$ , which is a prior distribution for the precision matrix.
ZI	logical. If FALSE (default), the conditional distribution of each response variable is assumed to be Discrete Weibull given the predictors x. If TRUE, a zero-inflated model will be applied to each response. ZI can be passed also as a vector, in order to specify which of the (p variables) should be fitted with zero-inflation (TRUE) or not (FALSE).

12 bdgraph.dw

iter\_bdw number of iterations for the sampling algorithm to estimate the regression parameters for the Discrete Weibull distribution. It is passed to the bdw. reg funccorresponds to a starting point of the graph. It could be an  $(p \times p)$  matrix, g.start "empty" (default), or "full". Option "empty" means that the initial graph is an empty graph and "full" means a full graph. It also could be an object with S3 class "bdgraph" of R package BDgraph or the class "ssgraph" of R package ssgraph::ssgraph(); this option can be used to run the sampling algorithm from the last objects of the previous run (see examples). jump it is only for the BDMCMC algorithm (algorithm = "bdmcmc"). It is for simultaneously updating multiple links at the same time while updating the graph in the BDMCMC algorithm. logical: if FALSE (default), the adjacency matrices are NOT saved. If TRUE, save the adjacency matrices after burn-in are saved. q, beta parameters of the discrete Weibull distribution used for the marginals. They should be given either as a  $(n \times p)$  matrix (if covariates are present) or as a vector (if covariates are not present). If NULL (default), these parameters are estimated by the bdw. reg function. pii vector or matrix of zero-inflation parameters of the zero-inflated discrete Weibull distributions used for the marginals. If NULL (default), this parameter is estimated by the bdw. reg function when ZI = TRUE. number of cores to use for parallel execution. The case cores = "all" means cores all CPU cores to use for parallel execution. threshold threshold value for the convergence of the sampling algorithm from G-Wishart for the precision matrix.

#### Value

verbose

An object with S3 class "bdgraph" is returned, containing:

p\_links upper triangular matrix corresponding to the estimated posterior probabilities of

logical: if TRUE (default), report/print the MCMC running time.

all possible links.

K\_hat posterior estimation of the precision matrix.

sample\_marginals

posterior samples of the regression coefficients of the marginal distributions.

For the case "save = TRUE", the code returns:

sample\_graphs vector of strings which includes the adjacency matrices of the graphs visited

after burn-in.

graph\_weights vector which includes the waiting times of the graphs visited after burn-in.

all\_graphs vector which includes the identity of the adjacency matrices for all iterations

after burn-in. It is needed for monitoring the convergence of the BDMCMC

algorithm.

all\_weights vector which includes the waiting times for all iterations after burn-in. It is

needed for monitoring the convergence of the BDMCMC algorithm.

Search algorithm in graphical models using marginal pseudolikehlihood

# Description

This function consists of several sampling algorithms for Bayesian model determination in undirected graphical models based on mariginal pseudo-likelihood. To speed up the computations, the birth-death MCMC sampling algorithms are implemented in parallel using **OpenMP** in C++.

# Usage

## **Arguments**

data	there are two options: (1) an $(n \times p)$ matrix or a data.frame corresponding to the data, (2) an $(p \times p)$ covariance matrix as $S = X'X$ which $X$ is the data matrix $(n)$ is the sample size and $p$ is the number of variables). It also could be an object of class "sim", from function bdgraph.sim. The input matrix is automatically identified by checking the symmetry.
n	number of observations. It is needed if the "data" is a covariance matrix.
method	character with two options "ggm" (default), "dgm" and "dgm-binary". Option "ggm" is for Gaussian graphical models based on Gaussianity assumption. Option "dgm" is for discrete graphical models for the count data. Option "dgm-binary" is for discrete graphical models for the data that are binary.
transfer	for only 'count' data which method = "dgm" or method = "dgm-binary".
algorithm	character with two options "bdmcmc" (default) and "rjmcmc". Option "bdmcmc" is based on birth-death MCMC algorithm. Option "rjmcmc" is based on reverible jump MCMC algorithm. Option "hc" is based on hill-climbing algorithm; this algorithm is only for count data which method = "dgm" or method = "dgm-binary".
iter	number of iteration for the sampling algorithm.
burnin	number of burn-in iteration for the sampling algorithm.

bdgraph.mpl 15

g.prior	for determining the prior distribution of each edge in the graph. There are two options: a single value between 0 and 1 (e.g. $0.5$ as a noninformative prior) or an $(p \times p)$ matrix with elements between 0 and 1.
g.start	corresponds to a starting point of the graph. It could be an $(p \times p)$ matrix, "empty" (default), or "full". Option "empty" means the initial graph is an empty graph and "full" means a full graph. It also could be an object with S3 class "bdgraph" of R package BDgraph or the class "ssgraph" of R package ssgraph::ssgraph(); this option can be used to run the sampling algorithm from the last objects of previous run (see examples).
jump	it is only for the BDMCMC algorithm (algorithm = "bdmcmc"). It is for simultaneously updating multiple links at the same time to update graph in the BDMCMC algorithm.
alpha	value of the hyper parameter of Dirichlet, which is a prior distribution.
save	logical: if FALSE (default), the adjacency matrices are NOT saved. If TRUE, the adjacency matrices after burn-in are saved.
cores	number of cores to use for parallel execution. The case $cores = "all"$ means all CPU cores to use for parallel execution.
operator	character with two options "or" (default) and "and". It is for hill-climbing algorithm.
verbose	logical: if TRUE (default), report/print the MCMC running time.

## Value

An object with S3 class "bdgraph" is returned:

p\_links upper triangular matrix which corresponds the estimated posterior probabilities of all possible links.

For the case "save = TRUE" is returned:

sample\_graphs vector of strings which includes the adjacency matrices of visited graphs after burn-in.

graph\_weights vector which includes the waiting times of visited graphs after burn-in.

all\_graphs vector which includes the identity of the adjacency matrices for all iterations after burn-in. It is needed for monitoring the convergence of the BD-MCMC algorithm.

all\_weights vector which includes the waiting times for all iterations after burn-in. It is needed for monitoring the convergence of the BD-MCMC algorithm.

bdgraph.npn

Nonparametric transfer

# Description

Transfers non-Gaussian data to Gaussian.

# Usage

```
bdgraph.npn( data, npn = "shrinkage", npn.thresh = NULL )
```

bdgraph.npn 17

# Arguments

data	$(n \times p)$ matrix or a data.frame corresponding to the data $(n$ is the sample size and $p$ is the number of variables).
npn	character with three options "shrinkage" (default), "truncation", and "skeptic". Option "shrinkage" is for the shrunken transformation, option "truncation" is for the truncated transformation and option "skeptic" is for the non-paranormal skeptic transformation. For more details see references.
npn.thresh	truncation threshold; it is only for the truncated transformation (npn= "truncation"). The default value is $1/(4n^{1/4}\sqrt{\pi\log(n)})$ .

## Value

 $(n \times p)$  matrix of transferred data, if npn = "shrinkage" or "truncation", and a non-paranormal correlation  $(p \times p)$  matrix, if npn = "skeptic".

bdgraph.sim

Graph data simulation

## **Description**

Simulating multivariate distributions with different types of underlying graph structures, including "random", "cluster", "smallworld", "scale-free", "lattice", "hub", "star", "circle", "AR(1)", and "AR(2)". Based on the underlying graph structure, the function generates different types of multivariate data, including "Gaussian", "non-Gaussian", "categorical", "pois" (Poisson), "nbinom" (negative binomial), "dweibull" (discrete Weibull), "binary", "t" (t-distribution), "alternative-t", or "mixed" data. This function can be used also for simulating only graphs by setting the option n=0 (default).

## Usage

```
bdgraph.sim( p = 10, graph = "random", n = 0, type = "Gaussian", prob = 0.2,
            size = NULL, mean = 0, class = NULL, cut = 4, b = 3,
            D = diag( p ), K = NULL, sigma = NULL,
            q = exp(-1), beta = 1, vis = FALSE, rewire = 0.05,
             range.mu = c(3, 5), range.dispersion = c(0.01, 0.1), nu = 1)
```

#### **Arguments**

number of variables (nodes).

graph structure with options "random", "cluster", "smallworld", "scale-free", "lattice", "hub", "star", "circle", "AR(1)", and "AR(2)". It could also be an adjacency matrix corresponding to a graph structure (an upper triangular matrix

'non-Gaussian', 'binary' and 'Gaussian', respectively.

in which  $g_{ij} = 1$  if there is a link between nodes i and j, otherwise  $g_{ij} = 0$ ).

number of samples required. Note that for the case n = 0, only the graph is

generated.

type of data with options "Gaussian" (default), "non-Gaussian", "categorical", "pois", "nbinom", "dweibull", "binary", "mixed", "t", and "alternative-t".

For the option "Gaussian", data are generated from a multivariate normal distribution. For the option "non-Gaussian", data are transferred from a multivariate normal distribution to a continuous multivariate non-Gaussian distribution via Exponential marginals. For the option "categorical", data are transferred from a multivariate normal distribution to multivariate 'categorical' data. For the option "pois", data are transferred from a multivariate normal distribution to a multivariate Poisson distribution. For the option "nbinom", data are transferred from a multivariate normal distribution to a multivariate Negative Binomial distribution. For the option "dweibull", data are transferred from a multivariate normal distribution to a multivariate discrete Weibull distribution with parameters q and beta. For the option "binary", data are generated directly from the joint distribution, in this case p must be less than 17. For the option "mixed", data are transferred from a multivariate normal distribution to a mixture of 'categorical',

p

graph

n

type

bdgraph.sim 19

prob	if graph = "random", it is the probability that a pair of nodes has a link.
size	number of links in the true graph (graph size).
mean	vector specifying the mean of the variables.
class	if graph = "cluster", it is the number of classes.
cut	if type = "categorical", it is the number of categories for simulating 'categorical' data.
b	degree of freedom for G-Wishart distribution, $W_G(b, D)$ .
D	positive definite $(p \times p)$ "scale" matrix for G-Wishart distribution, $W_G(b,D)$ . The default is an identity matrix.
K	if graph = "fixed", it is a positive-definite symmetric matrix, corresponding to the true precision matrix.
sigma	if graph = "fixed", it is a positive-definite symmetric matrix corresponding to the true covariance matrix.
q, beta	$\label{eq:continuous} \begin{tabular}{ll} if type = "dweibull", they are the parameters of the discrete Weibull distribution with density \\ \end{tabular}$

$$p(x, q, \beta) = q^{x^{\beta}} - q^{(x+1)^{\beta}}, \quad \forall x = \{0, 1, 2, \ldots\}.$$

They can be given either as a vector of length p or as an  $(n \times p)$  matrix, e.g. if covariates are available and a regression model is used.

vis visualize the true graph structure.

rewire rewiring probability for smallworld network. Must be between 0 and 1.

range.mu, range.dispersion

if type = "nbinom", vector with two elements specifying the range of parameters

for the Negative Binomial distribution.

nu if type = "t" or "alternative-t", it is the parameter of the t distribution with

density.

# Value

An object with S3 class "sim" is returned:

data generated data as an  $(n \times p)$  matrix. sigma covariance matrix of the generated data. K precision matrix of the generated data.

G adjacency matrix corresponding to the true graph structure.

bdw.reg

Bayesian estimation of (zero-inflated) Discrete Weibull regression

# **Description**

Bayesian estimation of the parameters for Discrete Weibull (DW) regression. The conditional distribution of the response given the predictors is assumed to be DW with parameters q and beta, dependent on the predictors, and, with an additional parameter pi under zero inflation.

## Usage

# Arguments

data	$\mbox{\tt data.frame}$ or $\mbox{\tt matrix}$ corresponding to the data, containing the variables in the model.
formula	object of class formula as a symbolic description of the model to be fitted. For the case of data.frame, it is taken as the model frame (see model.frame).
iter	number of iterations for the sampling algorithm.
burnin	number of burn-in iterations for the sampling algorithm.
dist.q	Prior density for the regression coefficients associated to the parameter q. The default is a Normal distribution (dnorm). Any density function which has two parameters and can support the log = TRUE flag can be used, e.g. dnorm, dlnorm, dunif etc.
dist.beta	Prior density for the regression coefficients associated to the parameter beta. The default is a Normal distribution (dnorm). Any density function which has two parameters and can support the log = TRUE flag can be used, e.g. dnorm, dlnorm, dunif etc.
par.q	vector of length two corresponding to the parameters of dist.q.
par.beta	vector of length two corresponding to the parameters of dist.beta.
par.pi	vector of length two corresponding to the parameters of the beta prior density on $pi$ .
initial.q, initi	al.beta, initial.pi vector of initial values for the regression coefficients and for pi (if ZI = TRUE).
ZI	logical: if FALSE (default), the conditional distribution of the response given the predictors is assumed to be DW with parameters q and beta. If TRUE, a zero-inflated DW distribution will be applied.
scale.proposal	scale of the proposal function. Setting to lower values results in an increase in the acceptance rate of the sampler.
adapt	logical: if TRUE (default), the proposals will be adapted. If FALSE, no adapting will be applied.
print	logical: if TRUE (default), tracing information is printed.

# **Details**

The regression model uses a logit link function on q and a log link function on beta, the two parameters of a DW distribution, with probability mass function given by

$$DW(y) = q^{y^{\beta}} - q^{(y+1)^{\beta}}, y = 0, 1, 2, \dots$$

For the case of zero inflation (ZI = TRUE), a zero-inflated DW is considered:

$$f(y) = (1 - pi)I(y = 0) + piDW(y)$$

where  $0 \le pi \le 1$  and I(y=0) is an indicator for the point mass at zero for the response y.

## Value

sampie	MCMC samples
q.est	posterior estimates of q
beta.est	posterior estimates of beta
pi.est	posterior estimates of pi
accept.rate	acceptance rate of the MCMC algorithm

bf

Bayes factor for two graphs

# **Description**

Compute the Bayes factor for two graph structures.

## Usage

```
bf( num, den, bdgraph.obj, log = TRUE )
```

# **Arguments**

num, den	adjacency matrix corresponding to the true graph structure in which $a_{ij}=1$ if there is a link between notes $i$ and $j$ , otherwise $a_{ij}=0$ . It can be an object with S3 class "graph" from function graph.sim. It can be an object with S3 class "sim" from function bdgraph.sim.
bdgraph.obj	object of S3 class "bdgraph", from function bdgraph. It also can be an object of S3 class "ssgraph", from the function ssgraph::ssgraph() of R package ssgraph::ssgraph().
log	character value. If TRUE the Bayes factor is given as log(BF).

## Value

single numeric value, the Bayes factor of the two graph structures num and den.

compare

Graph structure comparison

# Description

This function provides several measures to assess the performance of the graphical structure learning.

# Usage

```
compare( pred, actual, main = NULL, vis = FALSE )
```

# **Arguments**

pred	adjacency matrix corresponding to an estimated graph. It can be an object with S3 class "bdgraph" from function bdgraph. It can be an object of S3 class "ssgraph", from the function ssgraph::ssgraph() of R package ssgraph::ssgraph(). It can be an object of S3 class "select", from the function huge.select of R package huge. It also can be a list of above objects for comparing two or more different approaches.
actual	adjacency matrix corresponding to the true graph structure in which $a_{ij}=1$ if there is a link between notes $i$ and $j$ , otherwise $a_{ij}=0$ . It can be an object with S3 class "sim" from function bdgraph.sim. It can be an object with S3 class "graph" from function graph.sim.
main	character vector giving the names for the result table.
vis	logical: if TRUE, visualize the true graph and estimated graph structures.

26 compare

#### Value

True positive number of correctly estimated links. True negative number of true non-existing links which is correctly estimated. False positive number of links which they are not in the true graph, but are incorrectly esti-False negative number of links which they are in the true graph, but are not estimated. F1-score weighted average of the "positive predictive" and "true positive rate". The F1-score value reaches its best value at 1 and worst score at 0. Specificity Specificity value reaches its best value at 1 and worst score at 0. Sensitivity Sensitivity value reaches its best value at 1 and worst score at 0. MCC Matthews Correlation Coefficients (MCC) value reaches its best value at 1 and worst score at 0.

# Description

Create a Confusion Matrix.

# Usage

```
conf.mat( pred, actual, cutoff = 0.5, proportion = FALSE, dnn = c( "Prediction", "Actual" ), ... )
```

# Arguments

pred	adjacency matrix corresponding to an estimated graph. It can be an object with S3 class "bdgraph" from function bdgraph. It can be an object of S3 class "ssgraph", from the function ssgraph::ssgraph() of R package ssgraph::ssgraph().
actual	adjacency matrix corresponding to the actual graph structure in which $a_{ij}=1$ if there is a link between notes $i$ and $j$ , otherwise $a_{ij}=0$ . It can be an object with S3 class "sim" from function bdgraph.sim. It can be an object with S3 class "graph" from function graph.sim. It can be a factor, numeric or character vector of responses (true class), typically encoded with 0 (controls) and 1 (cases). Only two classes can be used in a ROC curve.
cutoff	cutoff value for the case that pred is vector of probabilites. The default is 0.5.
proportion	logical: FALSE (default) for a confusion matrix with number of cases. TRUE, for a confusion matrix with the proportion of cases.
dnn	names to be given to the dimensions in the result (the dimnames names).
	further arguments to be passed to table.

# Value

the results of table on pred and actual.

## End(Not run)</pre>
```

conf.mat.plot

Plot Confusion Matrix

# **Description**

Plot a Confusion Matrix.

## Usage

# Arguments

pred	adjacency matrix corresponding to an estimated graph. It can be an object with S3 class "bdgraph" from function bdgraph. It can be an object of S3 class "ssgraph", from the function ssgraph::ssgraph() of R package ssgraph::ssgraph().
actual	adjacency matrix corresponding to the actual graph structure in which $a_{ij}=1$ if there is a link between notes $i$ and $j$ , otherwise $a_{ij}=0$ . It can be an object with S3 class "sim" from function bdgraph.sim. It can be an object with S3 class "graph" from function graph.sim. It can be a factor, numeric or character vector of responses (true class), typically encoded with 0 (controls) and 1 (cases). Only two classes can be used in a ROC curve.
cutoff	cutoff value for the case that pred is vector of probabilites. The default is 0.5.
conf.level	confidence level used for the confidence rings on the odds ratios. Must be a single nonnegative number less than 1; if set to 0 (the default), confidence rings are suppressed.
margin	numeric vector with the margins to equate. Must be one of 1 (the default), 2, or c(1, 2), which corresponds to standardizing the row, column, or both margins in each 2 by 2 table. Only used if std equals "margins".
color	vector of length 2 specifying the colors to use for the smaller and larger diagonals of each 2 by 2 table.
	options to be passed to fourfoldplot.

Discrete Weibull

*The Discrete Weibull Distribution (Type 1)* 

# **Description**

Density, distribution function, quantile function and random generation for the discrete Weibull distribution (type I) with parameters q and  $\beta$ .

# Usage

```
ddweibull( x, q = exp(-1), beta = 1, zero = TRUE ) pdweibull( x, q = exp(-1), beta = 1, zero = TRUE ) qdweibull( p, q = exp(-1), beta = 1, zero = TRUE ) rdweibull( p, q = exp(-1), beta = 1, zero = TRUE )
```

Discrete Weibull 31

# **Arguments**

X	vector of quantiles.
p	vector of probabilities.
q, beta	shape and scale parameters, the latter defaulting to 1.
zero	logical; if TRUE (default), the support contains 0; FALSE otherwise.
n	number of observations. If $length(n) > 1$ , the length is taken to be the number required.

## **Details**

The discrete Weibull distribution has density given by

$$f(x) = q^{x^{\beta}} - q^{(x+1)^{\beta}}, x = 0, 1, 2, \dots$$

For the case zero = FALSE:

$$f(x) = q^{(x-1)^{\beta}} - q^{x^{\beta}}, x = 1, 2, \dots$$

Cumulative distribution function

$$F(x) = 1 - q^{(x+1)^{\beta}}$$

For the case zero = FALSE, x+1 should replaced by x.

# Value

ddweibull gives the density, pdweibull gives the distribution function, qdweibull gives the quantile function, and rdweibull generates random values.

geneExpression

Human gene expression dataset

## **Description**

The dataset contains human gene expression of 100 transcripts (with unique Illumina TargetID) measured on 60 unrelated individuals.

## Usage

```
data( geneExpression )
```

#### **Format**

The format is a matrix with 60 rows (number of individuals) and 100 column (number of transcripts).

gnorm 33

gnorm

Normalizing constant for G-Wishart

# Description

Calculates log of the normalizing constant of G-Wishart distribution based on the Monte Carlo method, developed by Atay-Kayis and Massam (2005).

# Usage

```
gnorm( adj, b = 3, D = diag( ncol( adj ) ), iter = 100 )
```

## **Arguments**

adj	adjacency matrix corresponding to the graph structure. It is an upper triangular matrix in which $a_{ij} = 1$ if there is a link between notes $i$ and $j$ , otherwise
	$a_{ij} = 0.$
b	degree of freedom for G-Wishart distribution, $W_G(b, D)$ .
D	positive definite $(p \times p)$ "scale" matrix for G-Wishart distribution, $W_G(b,D)$ . The default is an identity matrix.
iter	number of iteration for the Monte Carlo approximation.

#### **Details**

Log of the normalizing constant approximation using Monte Carlo method for a G-Wishart distribution,  $K \sim W_G(b, D)$ , with density:

$$Pr(K) = \frac{1}{I(b,D)} |K|^{(b-2)/2} \exp\left\{-\frac{1}{2} \mathrm{trace}(K \times D)\right\}.$$

#### Value

Log of the normalizing constant of G-Wishart distribution.

```

# **Examples**

graph.sim

 $Graph\ simulation$ 

# **Description**

Simulating undirected graph structures, including "random", "cluster", "scale-free", "lattice", "hub", "star", and "circle".

# Usage

# **Arguments**

p	number of variables (nodes).
graph	undirected graph with options "random", "cluster", "smallworld", "scale-free", "lattice", "hub", "star", and "circle". It also could be an adjacency matrix corresponding to a graph structure (an upper triangular matrix in which $g_{ij}=1$ if there is a link between notes $i$ and $j$ , otherwise $g_{ij}=0$ ).
prob	if graph = "random", it is the probability that a pair of nodes has a link.
size	number of links in the true graph (graph size).
class	if graph = "cluster", it is the number of classes.
vis	visualize the true graph structure.
rewire	rewiring probability for smallworld network. Must be between 0 and 1.

## Value

The adjacency matrix corresponding to the simulated graph structure, as an object with S3 class "graph".

link2adj 35

## Author(s)

Reza Mohammadi <a.mohammadi@uva.nl> and Alexander Christensen

adj</pre>
```

link2adj

Extract links from an adjacency matrix

# **Description**

Extract links from an adjacency matrix or an object of calsses "sim" from function bdgraph.sim and "graph" from function graph.sim.

## Usage

```
link2adj( link, p = NULL )
```

## **Arguments**

link  $(2 \times p)$  matrix or a data.frame corresponding to the links from the graph structure.

p number of nodes of the graph.

# Value

An adjacency matrix corresponding to a graph structure in which  $a_{ij} = 1$  if there is a link between notes i and j, otherwise  $a_{ij} = 0$ .

# Author(s)

Reza Mohammadi <a.mohammadi@uva.nl>

```

mse

Graph structure comparison

# **Description**

Computes (weighted) mean squared error.

## Usage

```
mse( pred, actual, weight = FALSE )
```

## **Arguments**

pred adjacency matrix corresponding to an estimated graph. It can be an object with

S3 class "bdgraph" from function bdgraph. It can be an object of S3 class

"ssgraph", from the function ssgraph::ssgraph() of R package ssgraph::ssgraph().

It can be an object of S3 class "select", from the function huge.select of R package huge. It also can be a list of above objects for comparing two or more

different approaches.

actual adjacency matrix corresponding to the true graph structure in which  $a_{ij} = 1$  if

there is a link between notes i and j, otherwise  $a_{ij}=0$ . It can be an object with S3 class "sim" from function bdgraph.sim. It can be an object with S3 class

"graph" from function graph.sim.

weight for the case of weighted MSE.

# To compute the value of weighted MSE
mse( pred = sample.ggm, actual = data.sim, weight = 0.5 )

## End(Not run)</pre>
```

pgraph

Posterior probabilities of the graphs

# Description

Provides the estimated posterior probabilities for the most likely graphs or a specific graph.

# Usage

```
pgraph( bdgraph.obj, number.g = 4, adj = NULL )
```

# **Arguments**

bdgraph.obj	object of S3 class "bdgraph", from function bdgraph.
number.g	number of graphs with the highest posterior probabilities to be shown. This option is ignored if 'adj' is specified.
adj	adjacency matrix corresponding to a graph structure. It is an upper triangular matrix in which $a_{ij} = 1$ if there is a link between notes $i$ and $j$ , otherwise $a_{ij} = 0$ . It also can be an object of S3 class "sim", from function bdgraph.sim.

38 plinks

## Value

selected\_g adjacency matrices which corresponding to the graphs with the highest posterior probabilities.

prob\_g vector of the posterior probabilities of the graphs corresponding to 'selected\\_g'.

```

plinks

Estimated posterior link probabilities

## Description

Provides the estimated posterior link probabilities for all possible links in the graph.

plinks 39

# Usage

```
plinks( bdgraph.obj, round = 2, burnin = NULL )
```

# **Arguments**

bdgraph.obj object of S3 class "bdgraph", from function bdgraph. It also can be an object

of S3 class "ssgraph", from the function ssgraph::ssgraph() of R package

ssgraph::ssgraph().

round value for rounding all probabilities to the specified number of decimal places.

burnin number of burn-in iteration to scape.

plot.bdgraph

Plot function for S3 class "bdgraph"

# **Description**

Visualizes structure of the selected graphs which could be a graph with links for which their estimated posterior probabilities are greater than 0.5 or graph with the highest posterior probability.

# Usage

# **Arguments**

х	object of S3 class "bdgraph", from function bdgraph.	
cut	threshold for including the links in the selected graph based on the estimated posterior probabilities of the links; See the examples.	
number.g	number of graphs with the highest probabilities. This option works for the case running function bdgraph() with option save = TRUE; See the examples.	
main	Graphical parameter (see plot).	
layout	vertex placement which is according to R package igraph; For different layouts, see layout of R package igraph.	
vertex.size	vertex size which is according to R package igraph.	
vertex.color	vertex color which is according to R package igraph.	
vertex.frame.color		
	vertex frame color which is according to R package igraph.	
vertex.label vertex label. The default vertex labels are the vertex ids. vertex.label.dist		
	vertex label distance which is according to R package igraph.	
vertex.label.color		
	vertex label color which is according to R package igraph.	
edge.color	edge color which is according to R package igraph.

44 plotcoda

|--|

# **Description**

Visualizes the cumulative occupancy fractions of all possible links in the graph. It can be used for monitoring the convergence of the sampling algorithms, BDMCMC and RJMCMC.

# Usage

# **Arguments**

bdgraph.obj	object of S3 class "bdgraph", from function bdgraph. It also can be an object of S3 class "ssgraph", from the function ssgraph::ssgraph() of R package ssgraph::ssgraph().
thin	option for getting fast result for a cumulative plot according to part of the iteration.
control	logical: if TRUE (default) and the number of nodes is greater than 15, then 100 links randomly is selected for visualization.
main	graphical parameter (see plot).
verbose	logical: if TRUE (default), report/print the calculation progress.
	system reserved (no specific usage).

# **Details**

Note that a spending time for this function depends on the number of nodes. For fast result, you can choose bigger value for the 'thin' option.

precision

Estimated precision matrix

# Description

Provides the estimated precision matrix.

#### Usage

```
precision( bdgraph.obj, round = 2 )
```

# **Arguments**

bdgraph. obj object of S3 class "bdgraph", from function bdgraph. It also can be an object

of S3 class "ssgraph", from the function ssgraph::ssgraph() of R package

ssgraph::ssgraph().

round value for rounding all probabilities to the specified number of decimal places.

# Value

matrix which corresponds the estimated precision matrix.

rgwish 53

rgwish

Sampling from G-Wishart distribution

# **Description**

Generates random matrices, distributed according to the G-Wishart distribution with parameters b and D,  $W_G(b,D)$  with respect to the graph structure G. Note this fuction works for both non-decomposable and decomposable graphs.

# Usage

```
rgwish( n = 1, adj = NULL, b = 3, D = NULL, threshold = 1e-8)
```

# **Arguments**

n	number of samples required.
adj	adjacency matrix corresponding to the graph structure which can be non-decomposable or decomposable. It should be an upper triangular matrix in which $a_{ij}=1$ if there is a link between notes $i$ and $j$ , otherwise $a_{ij}=0$ . adj could be an object of class "graph", from function graph.sim. It also could be an object of class "sim", from function bdgraph.sim. It also could be an object of class "bdgraph", from functions bdgraph.mpl or bdgraph.
b	degree of freedom for G-Wishart distribution, $W_G(b, D)$ .
D	positive definite $(p \times p)$ "scale" matrix for G-Wishart distribution, $W_G(b,D)$ . The default is an identity matrix.
threshold	threshold value for the convergence of sampling algorithm from G-Wishart.

# **Details**

Sampling from G-Wishart distribution,  $K \sim W_G(b, D)$ , with density:

$$Pr(K) \propto |K|^{(b-2)/2} \exp\left\{-\frac{1}{2} \mathrm{trace}(K \times D)\right\},$$

which b > 2 is the degree of freedom and D is a symmetric positive definite matrix.

## Value

A numeric array, say A, of dimension  $(p \times p \times n)$ , where each A[, i] is a positive definite matrix, a realization of the G-Wishart distribution,  $W_G(b, D)$ . Note, for the case n = 1, the output is a matrix.

rmvnorm

Generate data from the multivariate Normal distribution

#### **Description**

Random generation function from the multivariate Normal distribution with mean equal to mean and covariance matrix sigma.

## Usage

## Arguments

```
n Number of observations. 

mean Mean vector, default is rep(0, length = ncol(sigma)). 

sigma positive definite covariance matrix, default is diag(length(mean)).
```

## Value

A numeric matrix with rows equal to n and columns equal to length(mean).

#### **Examples**

roc

Build a ROC curve

# Description

This function builds a ROC curve specifically for graph structure learning and returns a "roc" object, a list of class "roc". This object can be printed, plotted, or passed to the functions pROC::roc(), pROC::ci(), pROC::smooth.roc() and pROC::coords(). Additionally, two roc objects can be compared with pROC::roc.test(). This function is based on the roc function of R package pROC.

## Usage

```
roc( pred, actual, auc = TRUE, smooth = FALSE, plot = FALSE, quiet = TRUE, ... )
```

## **Arguments**

pred adjacency matrix (or a vector) corresponding to an estimated graph. It can be an object with S3 class "bdgraph" from function bdgraph. It can be an object

of S3 class "ssgraph", from the function ssgraph::ssgraph() of R package ssgraph::ssgraph(). It can be a numeric or ordered vector of the same

length than actual, containing the predicted value of each observation.

actual adjacency matrix (or a vector) corresponding to the actual graph structure in

which  $a_{ij}=1$  if there is a link between notes i and j, otherwise  $a_{ij}=0$ . It can be an object with S3 class "sim" from function bdgraph.sim. It can be an object with S3 class "graph" from function graph.sim. It can be a factor, numeric or character vector of responses (true class), typically encoded with 0 (controls)

and 1 (cases). Only two classes can be used in a ROC curve.

smooth if TRUE, the ROC curve is passed to smooth to be smoothed.

auc compute the area under the curve (AUC)? If TRUE (default), additional argu-

ments can be passed to pROC::auc().

56 roc

plot plot the ROC curve? If TRUE, additional arguments can be passed to pROC::plot.roc().

quiet if TRUE, turn off messages when direction and levels are auto-detected.

further arguments to be passed to pROC::roc().

#### Value

response

If the data contained any NA value and na.rm=FALSE, NA is returned. Otherwise, if smooth=FALSE, a list of class "roc" with the following fields:

auc if called with auc=TRUE, a numeric of class "auc" as defined in pROC::auc().

ci if called with ci=TRUE, a numeric of class "ci" as defined in pROC::ci().

the response vector. Patients whose response is not %in% levels are discarded.

If NA values were removed, a na.action attribute similar to na.omit stores the

row numbers.

predictor predictor vector converted to numeric as used to build the ROC curve. Patients

whose response is not %in% levels are discarded. If NA values were removed, a

na.action attribute similar to na.omit stores the row numbers.

original.predictor, original.response

response and predictor vectors as passed in argument.

levels levels of the response as defined in argument. controls predictor values for the control observations.

cases predictor values for the cases.

percent if the sensitivities, specificities and AUC are reported in percent, as defined in

argument.

direction direction of the comparison, as defined in argument.

fun.sesp function used to compute sensitivities and specificities. Will be re-used in boot-

strap operations.

sensitivities sensitivities defining the ROC curve. specificities specificities defining the ROC curve.

thresholds thresholds at which the sensitivities and specificities were computed. See below

for details.

call how the function was called. See function match.call for more details.

If smooth=TRUE a list of class "smooth.roc" as returned by pROC::smooth(), with or without additional elements auc and ci (according to the call).

rwish

Sampling from Wishart distribution

# **Description**

Generates random matrices, distributed according to the Wishart distribution with parameters b and D, W(b, D).

## Usage

```
rwish( n = 1, p = 2, b = 3, D = diag(p))
```

## **Arguments**

n	number of samples required.
р	number of variables (nodes).
b	degree of freedom for Wishart distribution, $W(b, D)$ .
D	positive definite $(p \times p)$ "scale" matrix for Wishart distribution, $W(b,D)$ . The default is an identity matrix.

58 select

## **Details**

Sampling from Wishart distribution,  $K \sim W(b, D)$ , with density:

$$Pr(K) \propto |K|^{(b-2)/2} \exp\left\{-rac{1}{2} \mathrm{trace}(K imes D)
ight\},$$

which b > 2 is the degree of freedom and D is a symmetric positive definite matrix.

# Value

A numeric array, say A, of dimension  $(p \times p \times n)$ , where each A[, i] is a positive definite matrix, a realization of the Wishart distribution W(b, D). Note, for the case n = 1, the output is a matrix.

surveyData

Labor force survey data

# **Description**

The survey dataset concerns 1002 males in the U.S labor force, described by Hoff (2007). The seven observed variables which have been measured on various scales are as follow: the income (income), degree (degree), the number of children (children), parents income (pincome), parents degree (pdegree), number of parents children (pchildren), and age (age).

## Usage

```
data( surveyData )
```

# **Format**

The format is a matrix with 1002 rows (number of individuals) and 7 column (number of variables).

## **Examples**

```
## Not run:
# Generating multivariate normal data from a 'random' graph
data.sim <- bdgraph.sim( n = 50, p = 6, size = 7, vis = TRUE )

bdgraph.obj <- bdgraph( data = data.sim, iter = 10000, burnin = 0, save = TRUE )

traceplot( bdgraph.obj )

traceplot( bdgraph.obj, acf = TRUE, pacf = TRUE )

## End(Not run)</pre>
```

transfer

transfer for count data

# **Description**

Transfers count data, by counting the duplicated rows.

# Usage

```
transfer( r_data )
```

## Arguments

r\_data

 $(n \times p)$  matrix or a data. frame corresponding to the data (n is the sample size and p is the number of variables).

### Value

 $(n \times p + 1)$  matrix of transferred data, in which the last column is the frequency of duplicated rows.

# Author(s)

Reza Mohammadi <a.mohammadi@uva.nl> and Adrian Dobra
