Index

Abbey

Daily price returns (in pence) of Abbey National shares between 7/31/91 and 10/8/91

# Description

Data used in problem 6.39

# Usage

Abbey

# Format

A data frame/tibble with 50 observations on one variable

price daily price returns (in pence) of Abbey National shares

# Source

Buckle, D. (1995), Bayesian Inference for Stable Distributions, *Journal of the American Statistical Association*, 90, 605-613.

# References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Description

Data used in Exercise 10.1

# Usage

Abc

### Format

A data frame/tibble with 54 observations on two variables

**response** a numeric vector

group a character vector A, B, and C

### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

# Examples

```
boxplot(response ~ group, col=c("red", "blue", "green"), data = Abc )
anova(lm(response ~ group, data = Abc))
```

Abilene

Crimes reported in Abilene, Texas

# Description

Data used in Exercise 1.23 and 2.79

# Usage

Abilene

# Format

A data frame/tibble with 16 observations on three variables

**crimetype** a character variable with values Aggravated assault, Arson, Burglary, Forcible rape, Larceny theft, Murder, Robbery, and Vehicle theft.

year a factor with levels 1992 and 1999

number number of reported crimes

# Ability

# Source

Uniform Crime Reports, US Dept. of Justice.

# References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

# Examples

## End(Not run)

Ability

Perceived math ability for 13-year olds by gender

#### Description

Data used in Exercise 8.57

#### Usage

Ability

# Format

A data frame/tibble with 400 observations on two variables

gender a factor with levels girls and boys

ability a factor with levels hopeless, belowavg, average, aboveavg, and superior

### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

#### Examples

CT <- xtabs(~gender + ability, data = Ability)
CT
chisq.test(CT)</pre>

Abortion

Abortion rate by region of country

### Description

Data used in Exercise 8.51

### Usage

Abortion

### Format

A data frame/tibble with 51 observations on the following 10 variables:

state a character variable with values alabama, alaska, arizona, arkansas, california, colorado, connecticut, delaware, dist of columbia, florida, georgia, hawaii, idaho, illinois, indiana, iowa, kansas, kentucky, louisiana, maine, maryland, massachusetts, michigan, minnesota, mississippi, missouri, montana, nebraska, nevada, new hampshire, new jersey, new mexico, new york, north carolina, north dakota, ohio, oklahoma, oregon, pennsylvania, rhode island, south carolina, south dakota, tennessee, texas, utah, vermont, virginia, washington, west virginia, wisconsin, and wyoming

region a character variable with values midwest northeast south west

- regcode a numeric vector
- rate1988 a numeric vector
- rate1992 a numeric vector
- rate1996 a numeric vector
- provide1988 a numeric vector
- provide1992 a numeric vector
- **lowhigh** a numeric vector

rate a factor with levels Low and High

# Absent

### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

# Examples

T1 <- xtabs(~region + rate, data = Abortion)
T1
chisq.test(T1)</pre>

Absent

# Number of absent days for 20 employees

# Description

Data used in Exercise 1.28

### Usage

Absent

# Format

A data frame/tibble with 20 observations on one variable

days days absent

### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

```
CT <- xtabs(~ days, data = Absent)
CT
barplot(CT, col = "pink", main = "Exercise 1.28")
plot(ecdf(Absent$days), main = "ECDF")</pre>
```

Achieve

### Description

Data used in Example 7.14 and Exercise 10.7

# Usage

Achieve

# Format

A data frame/tibble with 25 observations on two variables

score mathematics achiement score

gender a factor with 2 levels boys and girls

# References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Examples

anova(lm(score ~ gender, data = Achieve))
t.test(score ~ gender, var.equal = TRUE, data = Achieve)

Adsales

Number of ads versus number of sales for a retailer of satellite dishes

# Description

Data used in Exercise 9.15

#### Usage

Adsales

### Format

A data frame/tibble with six observations on three variables

month a character vector listing month

ads a numeric vector containing number of ads

sales a numeric vector containing number of sales

# Aggress

### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

#### Examples

```
plot(sales ~ ads, data = Adsales, main = "Exercise 9.15")
mod <- lm(sales ~ ads, data = Adsales)
abline(mod, col = "red")
summary(mod)
predict(mod, newdata = data.frame(ads = 6), interval = "conf", level = 0.99)</pre>
```

Aggress	Agressive tendency scores for a group of teenage members of a street
	gang

# Description

Data used in Exercises 1.66 and 1.81

# Usage

Aggress

# Format

A data frame/tibble with 28 observations on one variable

aggres measure of aggresive tendency, ranging from 10-50

### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

```
with(data = Aggress,
        EDA(aggres))
# OR
IQR(Aggress$aggres)
diff(range(Aggress$aggres))
```

Aid

Aid

Monthly payments per person for families in the AFDC federal program

### Description

Data used in Exercises 1.91 and 3.68

#### Usage

Aid

#### Format

A data frame/tibble with 51 observations on two variables

state a factor with levels Alabama, Alaska, Arizona, Arkansas, California, Colorado, Connecticut, Delaware, District of Colunbia, Florida, Georgia, Hawaii, Idaho, Illinois, Indiana, Iowa, Kansas, Kentucky, Louisiana, Maine, Maryland, Massachusetts, Michigan, Minnesota, Mississippi, Missour, Montana, Nebraska, Nevada, New Hampshire, New Jersey, New Mexico, New York, North Carolina, North Dakota, Ohio, Oklahoma, Oregon, Pennsylvania, Rhode Island, South Carolina, South Dakota, Tennessee, Texas, Utah, Vermont, Virginia, Washington, West Virginia, Wisconsin, and Wyoming

payment average monthly payment per person in a family

#### Source

US Department of Health and Human Services, 1993.

### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

```
hist(Aid$payment, xlab = "payment", main =
"Average monthly payment per person in a family",
col = "lightblue")
boxplot(Aid$payment, col = "lightblue")
dotplot(state ~ payment, data = Aid)
```

Aids

Incubation times for 295 patients thought to be infected with HIV by a blood transfusion

# Description

Data used in Exercise 6.60

### Usage

Aids

# Format

A data frame/tibble with 295 observations on three variables

duration time (in months) from HIV infection to the clinical manifestation of full-blown AIDS

age age (in years) of patient

group a numeric vector

### Source

Kalbsleich, J. and Lawless, J., (1989), An analysis of the data on transfusion related AIDS, *Journal of the American Statistical Association*, 84, 360-372.

# References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

```
with(data = Aids,
EDA(duration)
)
with(data = Aids,
    t.test(duration, mu = 30, alternative = "greater")
)
with(data = Aids,
    SIGN.test(duration, md = 24, alternative = "greater")
)
```

Airdisasters

### Description

Data used in Exercise 1.12

#### Usage

Airdisasters

### Format

A data frame /tibble with 141 observations on the following seven variables

year a numeric vector indicating the year of an aircraft accident

deaths a numeric vector indicating the number of deaths of an aircraft accident

decade a character vector indicating the decade of an aircraft accident

#### Source

2000 World Almanac and Book of Facts.

### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

```
par(las = 1)
stripchart(deaths ~ decade, data = Airdisasters,
            subset = decade != "1930s" & decade != "1940s",
            method = "stack", pch = 19, cex = 0.5, col = "red",
            main = "Aircraft Disasters 1950 - 1990",
            xlab = "Number of fatalities")
par(las = 0)
```

Airline

# Description

Data for Example 2.9

### Usage

Airline

# Format

A data frame/tibble with 11 observations on three variables

airline a charater variable with values Alaska, Amer West, American, Continental, Delta, Northwest, Pan Am, Southwest, TWA, United, and USAir

ontime a numeric vector

complaints complaints per 1000 passengers

#### Source

Transportation Department.

# References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

```
with(data = Airline,
    barplot(complaints, names.arg = airline, col = "lightblue",
    las = 2)
)
plot(complaints ~ ontime, data = Airline, pch = 19, col = "red",
    xlab = "On time", ylab = "Complaints")
```

Alcohol

# Description

Data used in Exercise 5.79

### Usage

Alcohol

### Format

A data frame/tibble with 14 observations on one variable

age age when individual started drinking

# References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Examples

qqnorm(Alcohol\$age)
qqline(Alcohol\$age)
SIGN.test(Alcohol\$age, md = 20, conf.level = 0.99)

Allergy

Allergy medicines by adverse events

### Description

Data used in Exercise 8.22

### Usage

Allergy

# Format

A data frame/tibble with 406 observations on two variables

event a factor with levels insomnia, headache, and drowsiness

medication a factor with levels seldane-d, pseudoephedrine, and placebo

### Anesthet

### Source

Marion Merrel Dow, Inc. Kansas City, Mo. 64114.

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Examples

```
T1 <- xtabs(~event + medication, data = Allergy)
T1
chisq.test(T1)</pre>
```

Anesthet

Recovery times for anesthetized patients

# Description

Data used in Exercise 5.58

### Usage

Anesthet

### Format

A with 10 observations on one variable

recover recovery time (in hours)

### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

```
qqnorm(Anesthet$recover)
qqline(Anesthet$recover)
with(data = Anesthet,
t.test(recover, conf.level = 0.90)$conf
)
```

Anxiety

# Description

Data used in Exercise 2.96

# Usage

Anxiety

### Format

A data frame/tibble with 20 observations on two variables

anxiety anxiety score before a major math test

math math test score

# References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Examples

```
plot(math ~ anxiety, data = Anxiety, ylab = "score",
    main = "Exercise 2.96")
with(data = Anxiety,
cor(math, anxiety)
)
linmod <- lm(math ~ anxiety, data = Anxiety)
abline(linmod, col = "purple")
summary(linmod)
```

Apolipop	Level of apolipoprotein B and number of cups of coffee consumed per
	day for 15 adult males

# Description

Data used in Examples 9.2 and 9.9

### Usage

Apolipop

# Append

# Format

A data frame/tibble with 15 observations on two variables

coffee number of cups of coffee per day

apolipB level of apoliprotein B

### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

# Examples

```
plot(apolipB ~ coffee, data = Apolipop)
linmod <- lm(apolipB ~ coffee, data = Apolipop)
summary(linmod)
summary(linmod)$sigma
anova(linmod)
anova(linmod)[2, 3]^.5
par(mfrow = c(2, 2))
plot(linmod)
par(mfrow = c(1, 1))
```

Append

Median costs of an appendectomy at 20 hospitals in North Carolina

# Description

Data for Exercise 1.119

# Usage

Append

### Format

A data frame/tibble with 20 observations on one variable

fee fees for an appendectomy for a random sample of 20 hospitals in North Carolina

### Source

North Carolina Medical Database Commission, August 1994.

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

# Appendec

### Examples

```
fee <- Append$fee
ll <- mean(fee) - 2*sd(fee)
ul <- mean(fee) + 2*sd(fee)
limits <-c(ll, ul)
limits
fee[fee < ll | fee > ul]
```

Appendec	Median costs of appendectomies at three different types of North Car-
	olina hospitals

# Description

Data for Exercise 10.60

### Usage

Appendec

### Format

A data frame/tibble with 59 observations on two variables

cost median costs of appendectomies at hospitals across the state of North Carolina in 1992

region a vector classifying each hospital as rural, regional, or metropolitan

# Source

*Consumer's Guide to Hospitalization Charges in North Carolina Hospitals* (August 1994), North Carolina Medical Database Commission, Department of Insurance.

# References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Examples

```
boxplot(cost ~ region, data = Appendec, col = c("red", "blue", "cyan"))
anova(lm(cost ~ region, data = Appendec))
```

24

Aptitude

# Description

Data for Exercises 2.1, 2.26, 2.35 and 2.51

### Usage

Aptitude

### Format

A data frame/tibble with 8 observations on two variables

aptitude aptitude test scores

product productivity scores

# References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Examples

```
plot(product ~ aptitude, data = Aptitude, main = "Exercise 2.1")
model1 <- lm(product ~ aptitude, data = Aptitude)
model1
abline(model1, col = "red", lwd=3)
resid(model1)
fitted(model1)
cor(Aptitude$product, Aptitude$aptitude)</pre>
```

Archaeo

Radiocarbon ages of observations taken from an archaeological site

# Description

Data for Exercises 5.120, 10.20 and Example 1.16

# Usage

Archaeo

### Arthriti

### Format

A data frame/tibble with 60 observations on two variables

age number of years before 1983 - the year the data were obtained

phase Ceramic Phase numbers

# Source

Cunliffe, B. (1984) and Naylor and Smith (1988).

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Examples

Arthriti

*Time of relief for three treatments of arthritis* 

# Description

Data for Exercise 10.58

### Usage

Arthriti

#### Format

A data frame/tibblewith 51 observations on two variables

time time (measured in days) until an arthritis sufferer experienced relief

treatment a factor with levels A, B, and C

# References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

# Artifici

# Examples

```
boxplot(time ~ treatment, data = Arthriti,
col = c("lightblue", "lightgreen", "yellow"),
ylab = "days")
anova(lm(time ~ treatment, data = Arthriti))
```

Artifici

Durations of operation for 15 artificial heart transplants

# Description

Data for Exercise 1.107

# Usage

Artifici

### Format

A data frame/tibble with 15 observations on one variable

duration duration (in hours) for transplant

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

```
stem(Artifici$duration, 2)
summary(Artifici$duration)
values <- Artifici$duration[Artifici$duration < 6.5]
values
summary(values)</pre>
```

Asprin

### Description

Data for Exercise 10.51

# Usage

Asprin

# Format

A data frame/tibble with 15 observations on two variables

time time (in seconds) for aspirin to dissolve

impurity impurity of an ingredient with levels 1%, 5%, and 10%

# References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

# Examples

Asthmati

Asthmatic relief index on nine subjects given a drug and a placebo

# Description

Data for Exercise 7.52

#### Usage

Asthmati

# Format

A data frame/tibble with nine observations on three variables

**drug** asthmatic relief index for patients given a drug

placebo asthmatic relief index for patients given a placebo

difference difference between the placebo and drug

#### Attorney

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

#### Examples

```
qqnorm(Asthmati$difference)
qqline(Asthmati$difference)
shapiro.test(Asthmati$difference)
with(data = Asthmati,
        t.test(placebo, drug, paired = TRUE, mu = 0, alternative = "greater")
)
```

Attorney

Number of convictions reported by U.S. attorney's offices

#### Description

Data for Example 2.2 and Exercises 2.43 and 2.57

#### Usage

Attorney

# Format

A data frame/tibble with 88 observations on three variables

staff U.S. attorneys' office staff per 1 million population

### convict U.S. attorneys' office convictions per 1 million population

district a factor with levels Albuquerque, Alexandria, Va, Anchorage, Asheville, NC, Atlanta, Baltimore, Baton Rouge, Billings, Mt, Birmingham, Al, Boise, Id, Boston, Buffalo, Burlington, Vt, Cedar Rapids, Charleston, WVA, Cheyenne, Wy, Chicago, Cincinnati, Cleveland, Columbia, SC, Concord, NH, Denver, Des Moines, Detroit, East St. Louis, Fargo, ND, Fort Smith, Ark, Fort Worth, Grand Rapids, Mi, Greensboro, NC, Honolulu, Houston, Indianapolis, Jackson, Miss, Kansas City, Knoxville, Tn, Las Vegas, Lexington, Ky, Little Rock, Los Angeles, Louisville, Memphis, Miami, Milwaukee, Minneapolis, Mobile, Ala, Montgomery, Ala, Muskogee, Ok, Nashville, New Haven, Conn, New Orleans, New York (Brooklyn), New York (Manhattan), Newark, NJ, Oklahoma City, Omaha, Oxford, Miss, Pensacola, Fl, Philadelphia, Phoenix, Pittsburgh, Portland, Maine, Portland, Ore, Providence, RI, Raleigh, NC, Roanoke, Va, Sacramento, Salt Lake City, San Antonio, San Diego, San Francisco, Savannah, Ga, Scranton, Pa, Seattle, Shreveport, La, Sioux Falls, SD, South Bend, Ind, Spokane, Wash ,Springfield, Ill, St. Louis, Syracuse, NY, Tampa, Topeka, Kan, Tulsa, Tyler, Tex, Washington, Wheeling, WVa, and Wilmington, Del

### References

#### Examples

```
par(mfrow=c(1, 2))
plot(convict ~ staff, data = Attorney, main = "With Washington, D.C.")
plot(convict[-86] ~staff[-86], data = Attorney,
main = "Without Washington, D.C.")
par(mfrow=c(1, 1))
```

Autogear

Number of defective auto gears produced by two manufacturers

# Description

Data for Exercise 7.46

#### Usage

Autogear

### Format

A data frame/tibble with 20 observations on two variables

defectives number of defective gears in the production of 100 gears per day

manufacturer a factor with levels A and B

# References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Examples

```
t.test(defectives ~ manufacturer, data = Autogear)
wilcox.test(defectives ~ manufacturer, data = Autogear)
t.test(defectives ~ manufacturer, var.equal = TRUE, data = Autogear)
```

30

Backtoback

# Description

Data for Exercise 7.40

### Usage

Backtoback

# Format

A data frame/tibble with 24 observations on two variables

score a numeric vector

group a numeric vector

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Examples

wilcox.test(score ~ group, data = Backtoback)
t.test(score ~ group, data = Backtoback)

Bbsalaries

Baseball salaries for members of five major league teams

# Description

Data for Exercise 1.11

### Usage

Bbsalaries

#### Format

A data frame/tibble with 142 observations on two variables

salary 1999 salary for baseball player

team a factor with levels Angels, Indians, Orioles, Redsoxs, and Whitesoxs

### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Examples

Bigten	Graduation rates for student athletes and nonathletes in the Big Ten
	Conf.

### Description

Data for Exercises 1.124 and 2.94

#### Usage

Bigten

#### Format

A data frame/tibble with 44 observations on the following four variables

school a factor with levels Illinois, Indiana, Iowa, Michigan, Michigan State, Minnesota, Northwestern, Ohio State, Penn State, Purdue, and Wisconsin

rate graduation rate

year factor with two levels 1984-1985 and 1993-1994

status factor with two levels athlete and student

#### Source

NCAA Graduation Rates Report, 2000.

### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

Biology

# Description

Data for Exercise 1.49

# Usage

Biology

# Format

A data frame/tibble with 30 observations on one variable

score test scores on the first test in a beginning biology class

# References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

# Examples

```
hist(Biology$score, breaks = "scott", col = "brown", freq = FALSE,
main = "Problem 1.49", xlab = "Test Score")
lines(density(Biology$score), lwd=3)
```

Birth

Live birth rates in 1990 and 1998 for all states

# Description

Data for Example 1.10

# Usage

Birth

### Format

A data frame/tibble with 51 observations on three variables

state a character with levels Alabama, Alaska, Arizona, Arkansas, California, Colorado, Connecticut, Delaware, District of Colunbia, Florida, Georgia, Hawaii, Idaho, Illinois, Indiana, Iowa, Kansas, Kentucky, Louisiana, Maine, Maryland, Massachusetts, Michigan, Minnesota, Mississippi, Missour, Montana, Nebraska, Nevada, New Hampshire, New Jersey, New Mexico, New York, North Carolina, North Dakota, Ohio, Oklahoma, Oregon, Pennsylvania, Rhode Island, South Carolina, South Dakota, Tennessee, Texas, Utah, Vermont, Virginia, Washington, West Virginia, Wisconsin, and Wyoming

rate live birth rates per 1000 population

year a factor with levels 1990 and 1998

# Source

National Vital Statistics Report, 48, March 28, 2000, National Center for Health Statistics.

### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Examples

```
rate1998 <- subset(Birth, year == "1998", select = rate)
stem(x = rate1998$rate, scale = 2)
hist(rate1998$rate, breaks = seq(10.9, 21.9, 1.0), xlab = "1998 Birth Rate",
    main = "Figure 1.14 in BSDA", col = "pink")
hist(rate1998$rate, breaks = seq(10.9, 21.9, 1.0), xlab = "1998 Birth Rate",
    main = "Figure 1.16 in BSDA", col = "pink", freq = FALSE)
lines(density(rate1998$rate), lwd = 3)
rm(rate1998)</pre>
```

Blackedu

Education level of blacks by gender

#### Description

Data for Exercise 8.55

#### Usage

Blackedu

# Blood

# Format

A data frame/tibble with 3800 observations on two variables

gender a factor with levels Female and Male

education a factor with levels High school dropout, High school graudate, Some college, Bachelor's degree, and Graduate degree

# Source

Bureau of Census data.

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Examples

```
T1 <- xtabs(~gender + education, data = Blackedu)
T1
chisq.test(T1)</pre>
```

Blood

Blood pressure of 15 adult males taken by machine and by an expert

# Description

Data for Exercise 7.84

# Usage

Blood

#### Format

A data frame/tibble with 15 observations on the following two variables

machine blood pressure recorded from an automated blood pressure machine

expert blood pressure recorded by an expert using an at-home device

### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

Board

### Examples

```
DIFF <- Blood$machine - Blood$expert
shapiro.test(DIFF)
qqnorm(DIFF)
qqline(DIFF)
rm(DIFF)
t.test(Blood$machine, Blood$expert, paired = TRUE)</pre>
```

Board

Incomes of board members from three different universities

# Description

Data for Exercise 10.14

## Usage

Board

### Format

A data frame/tibble with 7 observations on three variables

salary 1999 salary (in \$1000) for board directors

university a factor with levels A, B, and C

# References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Examples

```
boxplot(salary ~ university, data = Board, col = c("red", "blue", "green"),
        ylab = "Income")
tapply(Board$salary, Board$university, summary)
anova(lm(salary ~ university, data = Board))
## Not run:
library(dplyr)
dplyr::group_by(Board, university) %>%
        summarize(Average = mean(salary))
```

## End(Not run)

36
Bones

## Description

Data for Example 7.22

## Usage

Bones

## Format

A data frame/tibble with 70 observations on two variables

density bone density measurements

group a factor with levels active and nonactive

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Examples

```
t.test(density ~ group, data = Bones, alternative = "greater")
t.test(rank(density) ~ group, data = Bones, alternative = "greater")
wilcox.test(density ~ group, data = Bones, alternative = "greater")
```

Books

Number of books read and final spelling scores for 17 third graders

### Description

Data for Exercise 9.53

#### Usage

Books

Bookstor

#### Format

A data frame/tibble with 17 observations on two variables

book number of books read

spelling spelling score

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

```
plot(spelling ~ book, data = Books)
mod <- lm(spelling ~ book, data = Books)
summary(mod)
abline(mod, col = "blue", lwd = 2)</pre>
```

```
Bookstor
```

Prices paid for used books at three different bookstores

### Description

Data for Exercise 10.30 and 10.31

#### Usage

Bookstor

## Format

A data frame/tibble with 72 observations on two variables

dollars money obtained for selling textbooks

store a factor with levels A, B, and C

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Examples

38

Brain

### Description

Data for Exercises 2.15, 2.44, 2.58 and Examples 2.3 and 2.20

## Usage

Brain

## Format

A data frame/tibble with 28 observations on three variables

species a factor with levels African elephant, Asian Elephant, Brachiosaurus, Cat, Chimpanzee, Cow, Diplodocus, Donkey, Giraffe, Goat, Gorilla, Gray wolf, Guinea Pig, Hamster, Horse, Human, Jaguar, Kangaroo, Mole, Mouse, Mt Beaver, Pig, Potar monkey, Rabbit, Rat, Rhesus monkey, Sheep, and Triceratops

bodyweight body weight (in kg)

brainweight brain weight (in g)

## Source

P. Rousseeuw and A. Leroy, Robust Regression and Outlier Detection (New York: Wiley, 1987).

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

Bumpers

### Description

Data for Exercise 1.73

## Usage

Bumpers

#### Format

A data frame/tibble with 23 observations on two variables

- car a factor with levels Buick Century, Buick Skylark, Chevrolet Cavalier, Chevrolet Corsica, Chevrolet Lumina, Dodge Dynasty, Dodge Monaco, Ford Taurus, Ford Tempo, Honda Accord, Hyundai Sonata, Mazda 626, Mitsubishi Galant, Nissan Stanza, Oldsmobile Calais, Oldsmobile Ciere, Plymouth Acclaim, Pontiac 6000, Pontiac Grand Am, Pontiac Sunbird, Saturn SL2, Subaru Legacy, and Toyota Camry
- **repair** total repair cost (in dollars) after crashing a car into a barrier four times while the car was traveling at 5 miles per hour

#### Source

Insurance Institute of Highway Safety.

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

```
EDA(Bumpers$repair)
stripchart(Bumpers$repair, method = "stack", pch = 19, col = "blue")
library(lattice)
dotplot(car ~ repair, data = Bumpers)
```

Bus

## Description

Data for Exercise 8.25

## Usage

Bus

## Format

A data frame/tibble with 29363 observations on two variables

attendance a factor with levels absent and present

shift a factor with levels am, noon, pm, swing, and split

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

```
T1 <- xtabs(~attendance + shift, data = Bus)
T1
chisq.test(T1)</pre>
```

Bypass

Median charges for coronary bypass at 17 hospitals in North Carolina

## Description

Data for Exercises 5.104 and 6.43

### Usage

Bypass

## Format

A data frame/tibble with 17 observations on two variables

hospital a factor with levels Carolinas Med Ct, Duke Med Ct, Durham Regional, Forsyth Memorial, Frye Regional, High Point Regional, Memorial Mission, Mercy, Moore Regional, Moses Cone Memorial, NC Baptist, New Hanover Regional, Pitt Co. Memorial, Presbyterian, Rex, Univ of North Carolina, and Wake County

charge median charge for coronary bypass

#### Source

*Consumer's Guide to Hospitalization Charges in North Carolina Hospitals* (August 1994), North Carolina Medical Database Commission, Department of Insurance.

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Examples

```
EDA(Bypass$charge)
t.test(Bypass$charge, conf.level=.90)$conf
t.test(Bypass$charge, mu = 35000)
```

Ca		

Estimates of costs of kitchen cabinets by two suppliers on 20 prospective homes

## Description

Data for Exercise 7.83

### Usage

Cabinets

### Format

A data frame/tibble with 20 observations on three variables

home a numeric vector

supplA estimate for kitchen cabinets from supplier A (in dollars)

supplB estimate for kitchen cabinets from supplier A (in dollars)

### Cancer

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

```
DIF <- Cabinets$supplA - Cabinets$supplB
qqnorm(DIF)
qqline(DIF)
shapiro.test(DIF)
with(data = Cabinets,
        t.test(supplA, supplB, paired = TRUE)
)
with(data = Cabinets,
        wilcox.test(supplA, supplB, paired = TRUE)
)
rm(DIF)</pre>
```

Cancer

Survival times of terminal cancer patients treated with vitamin C

### Description

Data for Exercises 6.55 and 6.64

#### Usage

Cancer

### Format

A data frame/tibble with 64 observations on two variables

survival survival time (in days) of terminal patients treated with vitamin C

type a factor indicating type of cancer with levels breast, bronchus, colon, ovary, and stomach

#### Source

Cameron, E and Pauling, L. 1978. "Supplemental Ascorbate in the Supportive Treatment of Cancer." *Proceedings of the National Academy of Science*, 75, 4538-4542.

### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

```
boxplot(survival ~ type, Cancer, col = "blue")
stomach <- Cancer$survival[Cancer$type == "stomach"]
bronchus <- Cancer$survival[Cancer$type == "bronchus"]
boxplot(stomach, ylab = "Days")
SIGN.test(stomach, md = 100, alternative = "greater")
SIGN.test(bronchus, md = 100, alternative = "greater")
rm(bronchus, stomach)</pre>
```

Carbon

Carbon monoxide level measured at three industrial sites

## Description

Data for Exercise 10.28 and 10.29

### Usage

Carbon

## Format

A data frame/tibble with 24 observations on two variables

**CO** carbon monoxide measured (in parts per million)

site a factor with levels SiteA, SiteB, and SiteC

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

```
boxplot(CO ~ site, data = Carbon, col = "lightgreen")
kruskal.test(CO ~ site, data = Carbon)
```

44

Cat

### Description

Data for Exercise 1.116

### Usage

Cat

#### Format

A data frame/tibble with 17 observations on one variable

score reading score on the California Achievement Test

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

stem(Cat\$score)
fivenum(Cat\$score)
boxplot(Cat\$score, main = "Problem 1.116", col = "green")

Censored

Entry age and survival time of patients with small cell lung cancer under two different treatments

## Description

Data for Exercises 7.34 and 7.48

### Usage

Censored

## Format

A data frame/tibble with 121 observations on three variables

**survival** survival time (in days) of patients with small cell lung cancer

**treatment** a factor with levels armA and armB indicating the treatment a patient received **age** the age of the patient

### Source

Ying, Z., Jung, S., Wei, L. 1995. "Survival Analysis with Median Regression Models." *Journal of the American Statistical Association*, 90, 178-184.

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

#### Examples

```
boxplot(survival ~ treatment, data = Censored, col = "yellow")
wilcox.test(survival ~ treatment, data = Censored, alternative = "greater")
```

Challeng	Temperatures and O-ring failures for the launches of the space shuttle
	Challenger

#### Description

Data for Examples 1.11, 1.12, 1.13, 2.11 and 5.1

### Usage

Challeng

## Format

A data frame/tibble with 25 observations on four variables

flight a character variable indicating the flight

date date of the flight

temp temperature (in fahrenheit)

failures number of failures

#### Source

Dalal, S. R., Fowlkes, E. B., Hoadley, B. 1989. "Risk Analysis of the Space Shuttle: Pre-Challenger Prediction of Failure." *Journal of the American Statistical Association*, 84, No. 408, 945-957.

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Chemist

## Examples

```
stem(Challeng$temp)
summary(Challeng$temp)

```

Chemist

Starting salaries of 50 chemistry majors

### Description

Data for Example 5.3

## Usage

Chemist

## Format

A data frame/tibble with 50 observations on one variable

salary starting salary (in dollars) for chemistry major

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

EDA(Chemist\$salary)

Chesapea

### Description

Data for Exercise 6.41

#### Usage

Chesapea

## Format

A data frame/tibble with 16 observations on one variable

salinity surface salinity measurements (in parts per 1000) for station 11, offshore from Annanapolis, Maryland, on July 3-4, 1927.

## Source

Davis, J. (1986) *Statistics and Data Analysis in Geology, Second Edition*. John Wiley and Sons, New York.

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Examples

```
qqnorm(Chesapea$salinity)
qqline(Chesapea$salinity)
shapiro.test(Chesapea$salinity)
t.test(Chesapea$salinity, mu = 7)
```

Chevy	Insurance injury ratings of Chevrolet vehicles for 1990 and 1993 mod-
	els

## Description

Data for Exercise 8.35

## Usage

Chevy

## Chicken

## Format

A data frame/tibble with 67 observations on two variables

year a factor with levels 1988-90 and 1991-93

**frequency** a factor with levels much better than average, above average, average, below average, and much worse than average

## Source

Insurance Institute for Highway Safety and the Highway Loss Data Institute, 1995.

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

```
T1 <- xtabs(~year + frequency, data = Chevy)
T1
chisq.test(T1)
rm(T1)</pre>
```

Chicken

## Description

Data for Exercise 10.15

### Usage

Chicken

## Format

A data frame/tibble with 13 observations onthree variables

gain weight gain over a specified period

feed a factor with levels ration1, ration2, and ration3

### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

#### Examples

```
boxplot(gain ~ feed, col = c("red","blue","green"), data = Chicken)
anova(lm(gain ~ feed, data = Chicken))
```

Measurements of the thickness of the oxide layer of manufactured integrated circuits

#### Description

Data for Exercises 6.49 and 7.47

#### Usage

Chipavg

## Format

A data frame/tibble with 30 observations on three variables

wafer1 thickness of the oxide layer for wafer1

wafer2 thickness of the oxide layer for wafer2

thickness average thickness of the oxide layer of the eight measurements obtained from each set of two wafers

#### Source

Yashchin, E. 1995. "Likelihood Ratio Methods for Monitoring Parameters of a Nested Random Effect Model." *Journal of the American Statistical Association*, 90, 729-738.

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Examples

```
EDA(Chipavg$thickness)
t.test(Chipavg$thickness, mu = 1000)
boxplot(Chipavg$wafer1, Chipavg$wafer2, name = c("Wafer 1", "Wafer 2"))
shapiro.test(Chipavg$wafer1)
shapiro.test(Chipavg$wafer2)
t.test(Chipavg$wafer1, Chipavg$wafer2, var.equal = TRUE)
```

50

Chips

## Description

Data for Exercise 10.9

#### Usage

Chips

## Format

A data frame/tibble with 30 observations on eight variables

wafer11 first measurement of thickness of the oxide layer for wafer1

wafer12 second measurement of thickness of the oxide layer for wafer1

wafer13 third measurement of thickness of the oxide layer for wafer1

wafer14 fourth measurement of thickness of the oxide layer for wafer1

wafer21 first measurement of thickness of the oxide layer for wafer2

wafer22 second measurement of thickness of the oxide layer for wafer2

wafer23 third measurement of thickness of the oxide layer for wafer2

wafer24 fourth measurement of thickness of the oxide layer for wafer2

## Source

Yashchin, E. 1995. "Likelihood Ratio Methods for Monitoring Parameters of a Nested Random Effect Model." *Journal of the American Statistical Association*, 90, 729-738.

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

Cigar

## Description

Data for Example 10.4

## Usage

Cigar

## Format

A data frame/tibble with 100 observations on two variables

tar amount of tar (measured in milligrams)

brand a factor indicating cigarette brand with levels brandA, brandB, brandC, and brandD

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

boxplot(tar ~ brand, data = Cigar, col = "cyan", ylab = "mg tar")
anova(lm(tar ~ brand, data = Cigar))

Cigarett

Effect of mother's smoking on birth weight of newborn

## Description

Data for Exercise 2.27

## Usage

Cigarett

### Format

A data frame/tibble with 16 observations on two variables

**cigarettes** mothers' estimated average number of cigarettes smoked per day **weight** children's birth weights (in pounds)

## CIsim

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

CIsim

Confidence Interval Simulation Program

#### Description

This program simulates random samples from which it constructs confidence intervals for one of the parameters mean (Mu), variance (Sigma), or proportion of successes (Pi).

## Usage

```
CIsim(
samples = 100,
n = 30,
mu = 0,
sigma = 1,
conf.level = 0.95,
type = "Mean"
)
```

Arguments

samples n	the number of samples desired. the size of each sample.
mu	if constructing confidence intervals for the population mean or the population
	variance, mu is the population mean (i.e., type is one of either "Mean", or "Var"). If constructing confidence intervals for the poulation proportion of successes, the value entered for mu represents the population proportion of successes (Pi), and as such, must be a number between 0 and 1.
sigma	the population standard deviation. sigma is not required if confidence intervals are of type "Pi".
conf.level	confidence level for the graphed confidence intervals, restricted to lie between zero and one.

type	character string, one of "Mean", "Var" or "Pi", or just the initial letter of each,
	indicating the type of confidence interval simulation to perform.

#### Details

Default is to construct confidence intervals for the population mean. Simulated confidence intervals for the population variance or population proportion of successes are possible by selecting the appropriate value in the type argument.

## Value

Graph depicts simulated confidence intervals. The number of confidence intervals that do not contain the parameter of interest are counted and reported in the commands window.

### Author(s)

Alan T. Arnholt

#### Examples

```
CIsim(100, 30, 100, 10)
   # Simulates 100 samples of size 30 from
   # a normal distribution with mean 100
   # and standard deviation 10. From the
    # 100 simulated samples, 95% confidence
    # intervals for the Mean are constructed
    # and depicted in the graph.
CIsim(100, 30, 100, 10, type="Var")
    # Simulates 100 samples of size 30 from
   # a normal distribution with mean 100
   # and standard deviation 10. From the
    # 100 simulated samples, 95% confidence
   # intervals for the variance are constructed
    # and depicted in the graph.
CIsim(100, 50, .5, type="Pi", conf.level=.90)
    # Simulates 100 samples of size 50 from
   # a binomial distribution where the population
    # proportion of successes is 0.5. From the
```

# 100 simulated samples, 90% confidence

# intervals for Pi are constructed

# and depicted in the graph.

Citrus

## Description

Data for Exercise 9.7

## Usage

Citrus

## Format

A data frame/tibble with nine observations on two variables

age age of children

percent percent peak bone density

### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

```
model <- lm(percent ~ age, data = Citrus)
summary(model)
anova(model)
rm(model)</pre>
```

Clean	Residual contaminant following the use of three different cleansing
	agents

## Description

Data for Exercise 10.16

## Usage

Clean

Coaxial

### Format

A data frame/tibble with 45 observations on two variables

clean residual contaminants

agent a factor with levels A, B, and C

### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

```
boxplot(clean ~ agent, col = c("red", "blue", "green"), data = Clean)
anova(lm(clean ~ agent, data = Clean))
```

```
Coaxial
```

Signal loss from three types of coxial cable

#### Description

Data for Exercise 10.24 and 10.25

#### Usage

Coaxial

### Format

A data frame/tibble with 45 observations on two variables

signal signal loss per 1000 feet

cable factor with three levels of coaxial cable typeA, typeB, and typeC

### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Examples

```
boxplot(signal ~ cable, data = Coaxial, col = c("red", "green", "yellow"))
kruskal.test(signal ~ cable, data = Coaxial)
```

56

Coffee

## Description

Data for Exercise 7.55

## Usage

Coffee

## Format

A data frame/tibble with nine observations on three variables

without workers' productivity scores without a coffee break

with workers' productivity scores with a coffee break

differences with minus without

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Examples

```
qqnorm(Coffee$differences)
qqline(Coffee$differences)
shapiro.test(Coffee$differences)
t.test(Coffee$with, Coffee$without, paired = TRUE, alternative = "greater")
wilcox.test(Coffee$with, Coffee$without, paired = TRUE,
alternative = "greater")
```

Coins

Yearly returns on 12 investments

## Description

Data for Exercise 5.68

### Usage

Coins

## Format

A data frame/tibble with 12 observations on one variable

return yearly returns on each of 12 possible investments

### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

qqnorm(Coins\$return)
qqline(Coins\$return)

Combinations

# Description

Computes all possible combinations of n objects taken k at a time.

*Combinations* 

## Usage

Combinations(n, k)

### Arguments

n	a number.
k	a number less than or equal to n.

## Value

Returns a matrix containing the possible combinations of n objects taken k at a time.

#### See Also

SRS

```
Combinations(5,2)
# The columns in the matrix list the values of the 10 possible
# combinations of 5 things taken 2 at a time.
```

Commute

### Description

Data for Exercises 1.13, and 7.85

#### Usage

Commute

### Format

A data frame/tibble with 39 observations on three variables

city a factor with levels Atlanta, Baltimore, Boston, Buffalo, Charlotte, Chicago, Cincinnati, Cleveland, Columbus, Dallas, Denver, Detroit, Hartford, Houston, Indianapolis, Kansas City, Los Angeles, Miami, Milwaukee, Minneapolis, New Orleans, New York, Norfolk, Orlando, Philadelphia, Phoenix, Pittsburgh, Portland, Providence, Rochester, Sacramento, Salt Lake City, San Antonio, San Diego, San Francisco, Seattle, St. Louis, Tampa, and Washington

year year

time commute times

## Source

Federal Highway Administration.

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

Concept

## Description

Data for Exercise 1.68 and 1.82

### Usage

Concept

## Format

A data frame/tibble with 28 observations on one variable

self Tennessee self concept scores

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

#### Examples

```
summary(Concept$self)
sd(Concept$self)
diff(range(Concept$self))
IQR(Concept$self)
summary(Concept$self/10)
IQR(Concept$self/10)
sd(Concept$self/10)
diff(range(Concept$self/10))
```

Concrete	Compressive strength of concrete blocks made by two different meth-
	ods

## Description

Data for Example 7.17

### Usage

Concrete

Corn

## Format

A data frame/tibble with 20 observations on two variables

strength comprehensive strength (in pounds per square inch)

method factor with levels new and old indicating the method used to construct a concrete block

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Examples

wilcox.test(strength ~ method, data = Concrete, alternative = "greater")

Corn	Comparison of the yields of a new variety and a standard variety of
	corn planted on 12 plots of land

### Description

Data for Exercise 7.77

#### Usage

Corn

## Format

A data frame/tibble with 12 observations on three variables

new corn yield with new meathod
standard corn yield with standard method
differences new minus standard

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

```
boxplot(Corn$differences)
qqnorm(Corn$differences)
qqline(Corn$differences)
shapiro.test(Corn$differences)
t.test(Corn$differences, alternative = "greater")
```

Correlat

## Description

Data for Exercise 2.23

## Usage

Correlat

## Format

A data frame/tibble with 13 observations on two variables

x a numeric vector

y a numeric vector

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

#### Examples

plot(y ~ x, data = Correlat)
model <- lm(y ~ x, data = Correlat)
abline(model)
rm(model)</pre>

Counsel

Scores of 18 volunteers who participated in a counseling process

## Description

Data for Exercise 6.96

## Usage

Counsel

## Format

A data frame/tibble with 18 observations on one variable

score standardized psychology scores after a counseling process

#### References

Срі

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

EDA(Counsel\$score)
t.test(Counsel\$score, mu = 70)

Cpi

## Consumer price index from 1979 to 1998

## Description

Data for Exercise 1.34

## Usage

Cpi

## Format

A data frame/tibble with 20 observations on two variables

year year

cpi consumer price index

#### Source

Bureau of Labor Statistics.

### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

```
plot(cpi ~ year, data = Cpi, type = "1", lty = 2, lwd = 2, col = "red")
barplot(Cpi$cpi, col = "pink", las = 2, main = "Problem 1.34")
```

Crime

### Description

Data for Exercises 1.90, 2.32, 3.64, and 5.113

#### Usage

Crime

### Format

A data frame/tibble with 102 observations on three variables

state a factor with levels Alabama, Alaska, Arizona, Arkansas, California, Colorado, Connecticut, DC, Delaware, Florida, Georgia, Hawaii, Idaho, Illinois, Indiana, Iowa, Kansas, Kentucky, Louisiana, Maine, Maryland, Massachusetts, Michigan, Minnesota, Mississippi, Missour, Montana, Nebraska, Nevada, New Hampshire, New Jersey, New Mexico, New York, North Carolina, North Dakota, Ohio, Oklahoma, Oregon, Pennsylvania, Rhode Island, South Carolina, South Dakota, Tennessee, Texas, Utah, Vermont, Virginia, Washington, West Virginia, Wisconsin, and Wyoming

year a factor with levels 1983 and 1993

rate crime rate per 100,000 inhabitants

#### Source

U.S. Department of Justice, Bureau of Justice Statistics, *Sourcebook of Criminal Justice Statistics*, 1993.

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Examples

boxplot(rate ~ year, data = Crime, col = "red")

Darwin

## Description

Data for Exercise 7.62

### Usage

Darwin

## Format

A data frame/tibble with 15 observations on three variables

**pot** number of pot

cross height of plant (in inches) after a fixed period of time when cross-fertilized

self height of plant (in inches) after a fixed period of time when self-fertilized

### Source

Darwin, C. (1876) *The Effect of Cross- and Self-Fertilization in the Vegetable Kingdom*, 2nd edition, London.

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

```
differ <- Darwin$cross - Darwin$self
qqnorm(differ)
qqline(differ)
shapiro.test(differ)
wilcox.test(Darwin$cross, Darwin$self, paired = TRUE)
rm(differ)</pre>
```

Dealers

## Description

Data for Example 2.22

#### Usage

Dealers

## Format

A data frame/tibble with 122 observations on two variables

type a factor with levels Honda, Toyota, Mazda, Ford, Dodge, and Saturn

service a factor with levels Replaces unnecessarily and Follows manufacturer guidelines

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

#### Examples

```
xtabs(~type + service, data = Dealers)
T1 <- xtabs(~type + service, data = Dealers)
T1
addmargins(T1)
pt <- prop.table(T1, margin = 1)
pt
barplot(t(pt), col = c("red", "skyblue"), legend = colnames(T1))
rm(T1, pt)</pre>
```

Defectiv

Number of defective items produced by 20 employees

### Description

Data for Exercise 1.27

#### Usage

Defectiv

## Degree

## Format

A data frame/tibble with 20 observations on one variable

number number of defective items produced by the employees in a small business firm

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

#### Examples

```
T1 <- xtabs(~ number, data = Defectiv)
T1
barplot(T1, col = "pink", ylab = "Frequency",
xlab = "Defective Items Produced by Employees", main = "Problem 1.27")
rm(T1)</pre>
```

Degree

Percent of bachelor's degrees awarded women in 1970 versus 1990

### Description

Data for Exercise 2.75

#### Usage

Degree

## Format

A data frame/tibble with 1064 observations on two variables

field a factor with levels Health, Education, Foreign Language, Psychology, Fine Arts, Life Sciences, Business, Social Science, Physical Sciences, Engineering, and All Fields

awarded a factor with levels 1970 and 1990

### Source

U.S. Department of Health and Human Services, National Center for Education Statistics.

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Examples

```
T1 <- xtabs(~field + awarded, data = Degree)
T1
barplot(t(T1), beside = TRUE, col = c("red", "skyblue"), legend = colnames(T1))
rm(T1)</pre>
```

Delay

Delay times on 20 flights from four major air carriers

## Description

Data for Exercise 10.55

## Usage

Delay

## Format

A data frame/tibble with 80 observations on two variables

delay the delay time (in minutes) for 80 randomly selected flights

carrier a factor with levels A, B, C, and D

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

```
boxplot(delay ~ carrier, data = Delay,
    main = "Exercise 10.55", ylab = "minutes",
    col = "pink")
kruskal.test(delay ~carrier, data = Delay)
```

68

Depend

## Description

Data for Exercise 1.26

### Usage

Depend

## Format

A data frame/tibble with 50 observations on one variable

number number of dependent children in a family

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

#### Examples

T1 <- xtabs(~ number, data = Depend)
T1
barplot(T1, col = "lightblue", main = "Problem 1.26",
xlab = "Number of Dependent Children", ylab = "Frequency")
rm(T1)</pre>

Detroit

Educational levels of a sample of 40 auto workers in Detroit

### Description

Data for Exercise 5.21

### Usage

Detroit

## Format

A data frame/tibble with 40 observations on one variable

educ the educational level (in years) of a sample of 40 auto workers in a plant in Detroit

### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

EDA(Detroit\$educ)

Develop	Demographic characteristics of developmental students at 2-year col-
	leges and 4-year colleges

## Description

Data used for Exercise 8.50

## Usage

Develop

## Format

A data frame/tibble with 5656 observations on two variables

**race** a factor with levels African American, American Indian, Asian, Latino, and White **college** a factor with levels Two-year and Four-year

#### Source

Research in Development Education (1994), V. 11, 2.

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

```
T1 <- xtabs(~race + college, data = Develop)
T1
chisq.test(T1)
rm(T1)</pre>
```

Devmath

Test scores for students who failed developmental mathematics in the fall semester 1995

## Description

Data for Exercise 6.47

## Usage

Devmath

## Format

A data frame/tibble with 40 observations on one variable

score first exam score

## Source

Data provided by Dr. Anita Kitchens.

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

```
EDA(Devmath$score)
t.test(Devmath$score, mu = 80, alternative = "less")
```

Dice

Outcomes and probabilities of the roll of a pair of fair dice

## Description

Data for Exercise 3.109

## Usage

Dice

Diesel

### Format

A data frame/tibble with 11 observations on two variables

**x** possible outcomes for the sum of two dice

**px** probability for outcome x

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Examples

```
roll1 <- sample(1:6, 20000, replace = TRUE)
roll2 <- sample(1:6, 20000, replace = TRUE)
outcome <- roll1 + roll2
T1 <- table(outcome)/length(outcome)
remove(roll1, roll2, outcome)
T1
round(t(Dice), 5)
rm(roll1, roll2, T1)
```

Diesel

Diesel fuel prices in 1999-2000 in nine regions of the country

## Description

Data for Exercise 2.8

## Usage

Diesel

## Format

A data frame/tibble with 650 observations on three variables

date date when price was recorded

pricepergallon price per gallon (in dollars)

location a factor with levels California, CentralAtlantic, Coast, EastCoast, Gulf, LowerAtlantic, NatAvg, NorthEast, Rocky, and WesternMountain

#### Source

Energy Information Administration, National Enerfy Information Center: 1000 Independence Ave., SW, Washington, D.C., 20585.

72
# Diplomat

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

#### Examples

```
par(las = 2)
boxplot(pricepergallon ~ location, data = Diesel)
boxplot(pricepergallon ~ location,
       data = droplevels(Diesel[Diesel$location == "EastCoast" |
       Diesel$location == "Gulf" | Diesel$location == "NatAvg" |
       Diesel$location == "Rocky" | Diesel$location == "California", ]),
       col = "pink", main = "Exercise 2.8")
par(las = 1)
## Not run:
library(ggplot2)
ggplot2::ggplot(data = Diesel, aes(x = date, y = pricepergallon,
           color = location)) +
           geom_point() +
           geom_smooth(se = FALSE) +
           theme_bw() +
           labs(y = "Price per Gallon (in dollars)")
```

## End(Not run)

Diplomat

Parking tickets issued to diplomats

### Description

Data for Exercises 1.14 and 1.37

## Usage

Diplomat

#### Format

A data frame/tibble with 10 observations on three variables

**country** a factor with levels Brazil, Bulgaria, Egypt, Indonesia, Israel, Nigeria, Russia, S. Korea, Ukraine, and Venezuela

number total number of tickets

rate number of tickets per vehicle per month

## Source

Time, November 8, 1993. Figures are from January to June 1993.

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

```
par(las = 2, mfrow = c(2, 2))
stripchart(number ~ country, data = Diplomat, pch = 19,
          col= "red", vertical = TRUE)
stripchart(rate ~ country, data = Diplomat, pch = 19,

chisq.test(T1)
rm(T1)</pre>
```

Drug

# Number of trials to master a task for a group of 28 subjects assigned to a control and an experimental group

# Description

Data for Example 7.15

## Usage

Drug

#### Format

A data frame/tibble with 28 observations on two variables

trials number of trials to master a task

group a factor with levels control and experimental

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

Dyslexia

# Description

Data for Exercise 2.90

## Usage

Dyslexia

# Format

A data frame/tibble with eight observations on seven variables

words number of words read per minute

age age of participant

gender a factor with levels female and male

handed a factor with levels left and right

weight weight of participant (in pounds)

height height of participant (in inches)

children number of children in family

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

Earthqk

# Description

Data for Exercise 6.97

# Usage

Earthqk

#### Format

A data frame/tibble with 100 observations on two variables

year year seimic activity recorded

severity annual incidence of sever earthquakes

## Source

Quenoille, M.H. (1952), Associated Measurements, Butterworth, London. p 279.

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

```
EDA(Earthqk$severity)
t.test(Earthqk$severity, mu = 100, alternative = "greater")
```

EDA

Exploratory Data Anaalysis

#### Description

Function that produces a histogram, density plot, boxplot, and Q-Q plot.

#### Usage

EDA(x, trim = 0.05)

Educat

#### Arguments

x	numeric vector. NAs and Infs are allowed but will be removed.
trim	fraction (between 0 and 0.5, inclusive) of values to be trimmed from each end
	of the ordered data. If trim = 0.5, the result is the median.

# Details

Will not return command window information on data sets containing more than 5000 observations. It will however still produce graphical output for data sets containing more than 5000 observations.

## Value

Function returns various measures of center and location. The values returned for the Quartiles are based on the definitions provided in *BSDA*. The boxplot is based on the Quartiles returned in the commands window.

# Note

Requires package e1071.

# Author(s)

Alan T. Arnholt

## Examples

```
EDA(rnorm(100))
    # Produces four graphs for the 100 randomly
    # generated standard normal variates.
```

Educat	Crime rates versus the percent of the population without a high school
	degree

# Description

Data for Exercise 2.41

## Usage

Educat

## Eggs

## Format

A data frame/tibble with 51 observations on three variables

state a factor with levels Alabama, Alaska, Arizona, Arkansas, California, Colorado, Connecticut, DC, Delaware, Florida, Georgia, Hawaii, Idaho, Illinois, Indiana, Iowa, Kansas, Kentucky, Louisiana, Maine, Maryland, Massachusetts, Michigan, Minnesota, Mississippi, Missour, Montana, Nebraska, Nevada, New Hampshire, New Jersey, New Mexico, New York, North Carolina, North Dakota, Ohio, Oklahoma, Oregon, Pennsylvania, Rhode Island, South Carolina, South Dakota, Tennessee, Texas, Utah, Vermont, Virginia, Washington, West Virginia, Wisconsin, and Wyoming

nodegree percent of the population without a high school degree

crime violent crimes per 100,000 population

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

Eggs

Number of eggs versus amounts of feed supplement

# Description

Data for Exercise 9.22

#### Usage

Eggs

#### Format

A data frame/tibble with 12 observations on two variables

feed amount of feed supplement

eggs number of eggs per day for 100 chickens

```

Groupabc

Group data to illustrate analysis of variance

## Description

Data for Exercise 10.42

#### Usage

Groupabc

Groups

# Format

A data frame/tibble with 45 observations on two variables

group a factor with levels A, B, and C

response a numeric vector

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

```
Groups
```

An illustration of analysis of variance

#### Description

Data for Exercise 10.4

## Usage

Groups

# Format

A data frame/tibble with 78 observations on two variables

group a factor with levels A, B, and C

response a numeric vector

# References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Examples

```
boxplot(response ~ group, data = Groups, col = c("red", "blue", "green"))
anova(lm(response ~ group, data = Groups))
```

112

Gym

# Description

Data for Exercises 2.21 and 9.14

# Usage

Gym

# Format

A data frame/tibble with eight observations on three variables

age age of child

number number of gymnastic activities successfully completed

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

# Examples

```
plot(number ~ age, data = Gym)
model <- lm(number ~ age, data = Gym)
abline(model, col = "red")
summary(model)</pre>
```

Habits

Study habits of students in two matched school districts

# Description

Data for Exercise 7.57

#### Usage

Habits

## Haptoglo

#### Format

A data frame/tibble with 11 observations on four variables

A study habit score

**B** study habit score

differ B minus A

signrks the signed-ranked-differences

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

```
shapiro.test(Habits$differ)
qqnorm(Habits$differ)
qqline(Habits$differ)
wilcox.test(Pair(B, A) ~ 1, data = Habits, alternative = "less")
t.test(Habits$signrks, alternative = "less")
```

```
## Not run:
library(ggplot2)
ggplot2::ggplot(data = Habits, aes(x = differ)) +
            geom_dotplot(fill = "blue") +
            theme_bw()
```

## End(Not run)

Haptoglo

Haptoglobin concentration in blood serum of 8 healthy adults

#### Description

Data for Example 6.9

## Usage

Haptoglo

#### Format

A data frame/tibble with eight observations on one variable

**concent** haptoglobin concentration (in grams per liter)

114

## Hardware

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

```
shapiro.test(Haptoglo$concent)
t.test(Haptoglo$concent, mu = 2, alternative = "less")
```

Hardware

Daily receipts for a small hardware store for 31 working days

## Description

Daily receipts for a small hardware store for 31 working days

#### Usage

Hardware

# Format

A data frame with 31 observations on one variable

receipt a numeric vector of daily receipts (in dollars)

#### Source

J.C. Miller and J.N. Miller, (1988), *Statistics for Analytical Chemistry*, 2nd Ed. (New York: Halsted Press).

### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Examples

stem(Hardware\$receipt)

Hardwood

## Description

Data for Example 2.18 and Exercise 9.34

## Usage

Hardwood

## Format

A data frame/tibble with 19 observations on two variables

tensile tensile strength of kraft paper (in pounds per square inch)

hardwood percent of hardwood in the batch of pulp that was used to produce the paper

## Source

G. Joglekar, et al., "Lack-of-Fit Testing When Replicates Are Not Available," *The American Statistician*, 43(3), (1989), 135-143.

# References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

```
plot(tensile ~ hardwood, data = Hardwood)
model <- lm(tensile ~ hardwood, data = Hardwood)
abline(model, col = "red")
plot(model, which = 1)</pre>
```

Heat

## Description

Data for Exercise 1.29

## Usage

Heat

# Format

A data frame/tibble with 301 observations on two variables

fuel a factor with levels Utility gas, LP bottled gas, Electricity, Fuel oil, Wood, and Other

**location** a factor with levels American Indians on reservation, All U.S. households, and American Indians not on reservations

## Source

Bureau of the Census, *Housing of the American Indians on Reservations*, Statistical Brief 95-11, April 1995.

### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

#### Examples

```
T1 <- xtabs(~ fuel + location, data = Heat)
T1
barplot(t(T1), beside = TRUE, legend = TRUE)
## Not run:
library(ggplot2)
ggplot2::ggplot(data = Heat, aes(x = fuel, fill = location)) +
        geom_bar(position = "dodge") +
        labs(y = "percent") +
        theme_bw() +
        theme(axis.text.x = element_text(angle = 30, hjust = 1))</pre>
```

## End(Not run)

Heating

# Description

Data for Exercise 10.32

# Usage

Heating

# Format

A data frame/tibble with 90 observations on the two variables

 $\mathbf{type}$  a factor with levels A, B, and C denoting the type of oil heater

efficiency heater efficiency rating

# References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

#### Examples

Hodgkin

Results of treatments for Hodgkin's disease

## Description

Data for Exercise 2.77

## Usage

Hodgkin

## Format

A data frame/tibble with 538 observations on two variables

type a factor with levels LD, LP, MC, and NS

response a factor with levels Positive, Partial, and None

## Homes

#### Source

I. Dunsmore, F. Daly, *Statistical Methods, Unit 9, Categorical Data*, Milton Keynes, The Open University, 18.

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

## End(Not run)

Homes	Median pr	ices	of s	single-family	homes	in (	65	metropolitan	statistica	l
	areas									

## Description

Data for Statistical Insight Chapter 5

#### Usage

Homes

#### Format

A data frame/tibble with 65 observations on the four variables

city a character variable with values Akron OH, Albuquerque NM, Anaheim CA, Atlanta GA, Baltimore MD, Baton Rouge LA, Birmingham AL, Boston MA, Bradenton FL, Buffalo NY, Charleston SC, Chicago IL, Cincinnati OH, Cleveland OH, Columbia SC, Columbus OH, Corpus Christi TX, Dallas TX, Daytona Beach FL, Denver CO, Des Moines IA, Detroit MI, El Paso TX, Grand Rapids MI, Hartford CT, Honolulu HI, Houston TX, Indianapolis IN, Jacksonville FL, Kansas City MO, Knoxville TN, Las Vegas NV, Los Angeles CA, Louisville KY, Madison WI, Memphis TN, Miami FL, Milwaukee WI, Minneapolis MN, Mobile AL, Nashville TN, New Haven CT, New Orleans LA, New York NY, Oklahoma City OK, Omaha NE, Orlando FL, Philadelphia PA, Phoenix AZ, Pittsburgh PA, Portland OR, Providence RI, Sacramento CA, Salt Lake

### Homework

City UT, San Antonio TX, San Diego CA, San Francisco CA, Seattle WA, Spokane WA, St Louis MO, Syracuse NY, Tampa FL, Toledo OH, Tulsa OK, and Washington DC

region a character variable with values Midwest, Northeast, South, and West

year a factor with levels 1994 and 2000

price median house price (in dollars)

## Source

National Association of Realtors.

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

# Examples

```
tapply(Homes$price, Homes$year, mean)
tapply(Homes$price, Homes$region, mean)
p2000 <- subset(Homes, year == "2000")
p1994 <- subset(Homes, year == "1994")
## Not run:
library(dplyr)
library(ggplot2)
dplyr::group_by(Homes, year, region) %>%
summarize(AvgPrice = mean(price))
ggplot2::ggplot(data = Homes, aes(x = region, y = price)) +
geom_boxplot() +
theme_bw() +
facet_grid(year ~ .)
## End(Not run)
```

Homework	Number of hours per week spent on homework for private and public
	high school students

## Description

Data for Exercise 7.78

#### Usage

Homework

## Honda

# Format

A data frame with 30 observations on two variables

school type of school either private or public

time number of hours per week spent on homework

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

Honda

Miles per gallon for a Honda Civic on 35 different occasions

## Description

Data for Statistical Insight Chapter 6

## Usage

Honda

## Format

A data frame/tibble with 35 observations on one variable

mileage miles per gallon for a Honda Civic

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

#### Examples

t.test(Honda\$mileage, mu = 40, alternative = "less")

Hostile

# Description

Data for Example 10.6

# Usage

Hostile

# Format

A data frame/tibble with 135 observations on two variables

location a factor with the location of the high school student (Rural, Suburban, or Urban)

hostility the score from the Hostility Level Test

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

Housing

Median home prices for 1984 and 1993 in 37 markets across the U.S.

# Description

Data for Exercise 5.82

#### Usage

Housing

## Hurrican

#### Format

A data frame/tibble with 74 observations on three variables

city a character variable with values Albany, Anaheim, Atlanta, Baltimore, Birmingham, Boston, Chicago, Cincinnati, Cleveland, Columbus, Dallas, Denver, Detroit, Ft Lauderdale, Houston, Indianapolis, Kansas City, Los Angeles, Louisville, Memphis, Miami, Milwaukee, Minneapolis, Nashville, New York, Oklahoma City, Philadelphia, Providence, Rochester, Salt Lake City, San Antonio, San Diego, San Francisco, San Jose, St Louis, Tampa, and Washington

year a factor with levels 1984 and 1993

price median house price (in dollars)

## Source

National Association of Realtors.

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

#### Examples

## End(Not run)

Hurrican	Number of storms, hurricanes and El Nino effects from 1950 through
	1995

## Description

Data for Exercises 1.38, 10.19, and Example 1.6

#### Usage

Hurrican

Iceberg

### Format

A data frame/tibble with 46 observations on four variables

year a numeric vector indicating yearstorms a numeric vector recording number of stormshurrican a numeric vector recording number of hurricaneselnino a factor with levels cold, neutral, and warm

#### Source

National Hurricane Center.

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Examples

Iceberg

Number of icebergs sighted each month south of Newfoundland and south of the Grand Banks in 1920

#### Description

Data for Exercise 2.46 and 2.60

#### Usage

Iceberg

#### Format

A data frame with 12 observations on three variables

month a character variable with abbreviated months of the year

Newfoundland number of icebergs sighted south of Newfoundland

Grand Banks number of icebergs sighted south of Grand Banks

## 124

## Income

#### Source

N. Shaw, *Manual of Meteorology*, Vol. 2 (London: Cambridge University Press 1942), 7; and F. Mosteller and J. Tukey, *Data Analysis and Regression* (Reading, MA: Addison - Wesley, 1977).

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Examples

```
plot(Newfoundland ~ `Grand Banks`, data = Iceberg)
abline(lm(Newfoundland ~ `Grand Banks`, data = Iceberg), col = "blue")
```

Income

Percent change in personal income from 1st to 2nd quarter in 2000

## Description

Data for Exercise 1.33

#### Usage

Income

#### Format

A data frame/tibble with 51 observations on two variables

state a character variable with values Alabama, Alaska, Arizona, Arkansas, California, Colorado, Connecticut, Delaware, District of Colunbia, Florida, Georgia, Hawaii, Idaho, Illinois, Indiana, Iowa, Kansas, Kentucky, Louisiana, Maine, Maryland, Massachusetts, Michigan, Minnesota, Mississippi, Missour, Montana, Nebraska, Nevada, New Hampshire, New Jersey, New Mexico, New York, North Carolina, North Dakota, Ohio, Oklahoma, Oregon, Pennsylvania, Rhode Island, South Carolina, South Dakota, Tennessee, Texas, Utah, Vermont, Virginia, Washington, West Virginia, Wisconsin, and Wyoming

percent\_change percent change in income from first quarter to the second quarter of 2000

#### Source

US Department of Commerce.

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

## End(Not run)

Independent

Illustrates a comparison problem for long-tailed distributions

#### Description

Data for Exercise 7.41

#### Usage

Independent

#### Format

A data frame/tibble with 46 observations on two variables

score a numeric vector

group a factor with levels A and B

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

```
qqnorm(Independent$score[Independent$group=="A"])
qqline(Independent$score[Independent$group=="A"])
qqline(Independent$score[Independent$group=="B"])
qqline(Independent$score[Independent$group=="B"])
boxplot(score ~ group, data = Independent, col = "blue")
wilcox.test(score ~ group, data = Independent)
```

126

Indian

Educational attainment versus per capita income and poverty rate for American indians living on reservations

## Description

Data for Exercise 2.95

#### Usage

Indian

#### Format

A data frame/tibble with ten observations on four variables

**reservation** a character variable with values Blackfeet, Fort Apache, Gila River, Hopi, Navajo, Papago, Pine Ridge, Rosebud, San Carlos, and Zuni Pueblo

percent high school percent who have graduated from high school

per capita income per capita income (in dollars)

poverty rate percent poverty

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

#### Examples

Indiapol

# Description

Data for Exercise 1.128

# Usage

Indiapol

## Format

A data frame/tibble with 39 observations on two variables

year the year of the race

speed the winners average speed (in mph)

# Source

The World Almanac and Book of Facts, 2000, p. 1004.

# References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

# Examples

plot(speed ~ year, data = Indiapol, type = "b")

Indy500	Qualifying miles per hour and number of previous starts for drivers in
	79th Indianapolis 500 race

## Description

Data for Exercises 7.11 and 7.36

#### Usage

Indy500

## Inflatio

## Format

A data frame/tibble with 33 observations on four variables

- driver a character variable with values andretti, bachelart, boesel, brayton, c.guerrero, cheever, fabi, fernandez, ferran, fittipaldi, fox, goodyear, gordon, gugelmin, herta, james, johansson, jones, lazier, luyendyk, matsuda, matsushita, pruett, r.guerrero, rahal, ribeiro, salazar, sharp, sullivan, tracy, vasser, villeneuve, and zampedri
- qualif qualifying speed (in mph)
- starts number of Indianapolis 500 starts
- **group** a numeric vector where 1 indicates the driver has 4 or fewer Indianapolis 500 starts and a 2 for drivers with 5 or more Indianapolis 500 starts

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

#### Examples

## End(Not run)

Inflatio

## Description

Data for Exercises 2.12 and 2.29

#### Usage

Inflatio

## Inletoil

# Format

A data frame/tibble with 24 observations on four variables

year a numeric vector of years

pay average hourly wage for salaried employees (in dollars)

increase percent increase in hourly wage over previous year

inflation percent inflation rate

## Source

Bureau of Labor Statistics.

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

# Examples

```
plot(increase ~ inflation, data = Inflatio)
cor(Inflatio$increase, Inflatio$inflation, use = "complete.obs")
```

Inletoil

Inlet oil temperature through a valve

## Description

Data for Exercises 5.91 and 6.48

## Usage

Inletoil

#### Format

A data frame/tibble with 12 observations on one variable

temp inlet oil temperature (Fahrenheit)

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

#### 130

## Inmate

## Examples

```
hist(Inletoil$temp, breaks = 3)
qqnorm(Inletoil$temp)
qqline(Inletoil$temp)
t.test(Inletoil$temp)
t.test(Inletoil$temp, mu = 98, alternative = "less")
```

Inmate

Type of drug offense by race

## Description

Data for Statistical Insight Chapter 8

#### Usage

Inmate

## Format

A data frame/tibble with 28,047 observations on two variables

race a factor with levels white, black, and hispanic

drug a factor with levels heroin, crack, cocaine, and marijuana

## Source

C. Wolf Harlow (1994), *Comparing Federal and State Prison Inmates*, NCJ-145864, U.S. Department of Justice, Bureau of Justice Statistics.

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

```
T1 <- xtabs(~race + drug, data = Inmate)
T1
chisq.test(T1)
rm(T1)</pre>
```

Inspect

#### Description

Data for Exercise 8.59

## Usage

Inspect

## Format

A data frame/tibble with 174 observations on two variables

station a factor with levels auto inspection, auto repair, car care center, gas station, new car dealer, and tire store

passed a factor with levels less than 70%, between 70% and 84%, and more than 85%

## Source

The Charlotte Observer, December 13, 1992.

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

#### Examples

## End(Not run)

Insulate

## Description

Data for Exercise 9.50

#### Usage

Insulate

#### Format

A data frame/tibble with ten observations on two variables

temp outside temperature (in degrees Celcius)

loss heat loss (in BTUs)

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

# Examples

## End(Not run)

Iqgpa

## Description

Data for Exercises 9.51 and 9.52

# Usage

Iqgpa

# Format

A data frame/tibble with 12 observations on two variables

iq IQ scores

gpa Grade point average

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

```
plot(gpa ~ iq, data = Iqgpa, col = "blue", pch = 19)
model <- lm(gpa ~ iq, data = Iqgpa)
summary(model)
rm(model)</pre>
```

Irises

R.A. Fishers famous data on Irises

# Description

Data for Examples 1.15 and 5.19

#### Usage

Irises

#### Jdpower

# Format

A data frame/tibble with 150 observations on five variables

sepal\_length sepal length (in cm)

sepal\_width sepal width (in cm)

petal\_length petal length (in cm)

petal\_width petal width (in cm)

species a factor with levels setosa, versicolor, and virginica

# Source

Fisher, R. A. (1936) The use of multiple measurements in taxonomic problems. *Annals of Eugenics*, 7, Part II, 179-188.

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

#### Examples

```
tapply(Irises$sepal_length, Irises$species, mean)
t.test(Irises$sepal_length[Irises$species == "setosa"], conf.level = 0.99)
hist(Irises$sepal_length[Irises$species == "setosa"],
    main = "Sepal length for\n Iris Setosa",
    xlab = "Length (in cm)")
boxplot(sepal_length ~ species, data = Irises)
```

Jdpower

Number of problems reported per 100 cars in 1994 versus 1995s

# Description

Data for Exercise 2.14, 2.17, 2.31, 2.33, and 2.40

#### Usage

Jdpower

## Format

A data frame/tibble with 29 observations on three variables

- car a factor with levels Acura, BMW, Buick, Cadillac, Chevrolet, Dodge Eagle, Ford, Geo, Honda, Hyundai, Infiniti, Jaguar, Lexus, Lincoln, Mazda, Mercedes-Benz, Mercury, Mitsubishi, Nissan, Oldsmobile, Plymouth, Pontiac, Saab, Saturn, and Subaru, Toyota Volkswagen, Volvo
- 1994 number of problems per 100 cars in 1994
- 1995 number of problems per 100 cars in 1995

## Source

USA Today, May 25, 1995.

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

# Examples

```
model <- lm(`1995` ~ `1994`, data = Jdpower)
summary(model)
plot(`1995` ~ `1994`, data = Jdpower)
abline(model, col = "red")
rm(model)</pre>
```

Jobsat

Job satisfaction and stress level for 9 school teachers

## Description

Data for Exercise 9.60

## Usage

Jobsat

#### Format

A data frame/tibble with nine observations on two variables

wspt Wilson Stress Profile score for teachers

satisfaction job satisfaction score

## Kidsmoke

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

```
plot(satisfaction ~ wspt, data = Jobsat)
model <- lm(satisfaction ~ wspt, data = Jobsat)
abline(model, col = "blue")
summary(model)
rm(model)</pre>
```

Kidsmoke

Smoking habits of boys and girls ages 12 to 18

#### Description

Data for Exercise 4.85

## Usage

Kidsmoke

#### Format

A data frame/tibble with 1000 observations on two variables

gender character vector with values female and male

smoke a character vector with values no and yes

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

```
T1 <- xtabs(~smoke + gender, data = Kidsmoke)
T1
prop.table(T1)
prop.table(T1, 1)
prop.table(T1, 2)</pre>
```

Kilowatt

## Description

Data for Example 5.9

## Usage

Kilowatt

#### Format

A data frame/tibble with 51 observations on two variables

state a factor with levels Alabama Alaska, Arizona, Arkansas California, Colorado, Connecticut, Delaware, District of Columbia, Florida, Georgia, Hawaii, Idaho, Illinois, Indiana, Iowa Kansas Kentucky, Louisiana, Maine, Maryland, Massachusetts, Michigan, Minnesota, Mississippi, Missour, Montana Nebraska, Nevada, New Hampshire, New Jersey, New Mexico, New York, North Carolina, North Dakota, Ohio, Oklahoma, Oregon, Pennsylvania, Rhode Island, South Carolina, South Dakota, Tennessee, Texas, Utah, Vermont, Virginia Washington, West Virginia, Wisconsin, and Wyoming

rate a numeric vector indicating rates for kilowatt per hour

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

#### Examples

EDA(Kilowatt\$rate)

Kinder	Reading scores for first grade children who attended kindergarten ver-
	sus those who did not

## Description

Data for Exercise 7.68

#### Usage

Kinder

## Laminect

#### Format

A data frame/tibble with eight observations on three variables

pair a numeric indicator of pair

kinder reading score of kids who went to kindergarten

nokinder reading score of kids who did not go to kindergarten

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

#### Examples

```
boxplot(Kinder$kinder, Kinder$nokinder)
diff <- Kinder$kinder - Kinder$nokinder
qqnorm(diff)
qqline(diff)
shapiro.test(diff)
t.test(diff)
rm(diff)</pre>
```

Laminect	Median costs of laminectomies at hospitals across North Carolina in
	1992

## Description

Data for Exercise 10.18

#### Usage

Laminect

#### Format

A data frame/tibble with 138 observations on two variables

area a character vector indicating the area of the hospital with Rural, Regional, and Metropol

cost a numeric vector indicating cost of a laminectomy

#### Source

*Consumer's Guide to Hospitalization Charges in North Carolina Hospitals* (August 1994), North Carolina Medical Database Commission, Department of Insurance.

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

#### Examples

```
boxplot(cost ~ area, data = Laminect, col = topo.colors(3))
anova(lm(cost ~ area, data = Laminect))
```

Lead	Lead levels in children's blood whose parents worked in a battery fac-
	tory

## Description

Data for Example 1.17

# Usage

Lead

## Format

A data frame/tibble with 66 observations on the two variables

**group** a character vector with values exposed and control

lead a numeric vector indicating the level of lead in children's blood (in micrograms/dl)

#### Source

Morton, D. et al. (1982), "Lead Absorption in Children of Employees in a Lead-Related Industry," *American Journal of Epidemiology*, 155, 549-555.

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

boxplot(lead ~ group, data = Lead, col = topo.colors(2))

## 140

Leader

## Description

Data for Exercise 7.31

## Usage

Leader

## Format

A data frame/tibble with 34 observations on two variables

age a character vector indicating age with values under 35 and over 35

score score on a leadership exam

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

boxplot(score ~ age, data = Leader, col = c("gray", "green"))
t.test(score ~ age, data = Leader)

Lethal

Survival time of mice injected with an experimental lethal drug

# Description

Data for Example 6.12

#### Usage

Lethal

### Format

A data frame/tibble with 30 observations on one variable

survival a numeric vector indicating time survived after injection (in seconds)

## 142

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

#### Examples

```
SIGN.test(Lethal$survival, md = 45, alternative = "less")
```

Life

Life expectancy of men and women in U.S.

## Description

Data for Exercise 1.31

## Usage

Life

## Format

A data frame/tibble with eight observations on three variables

year a numeric vector indicating year

men life expectancy for men (in years)

women life expectancy for women (in years)

## Source

National Center for Health Statistics.

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

```
plot(men ~ year, type = "l", ylim = c(min(men, women), max(men, women)),
        col = "blue", main = "Life Expectancy vs Year", ylab = "Age",
        xlab = "Year", data = Life)
lines(women ~ year, col = "red", data = Life)
text(1955, 65, "Men", col = "blue")
text(1955, 70, "Women", col = "red")
```

Lifespan

# Description

Data for Exercise 2.4, 2.37, and 2.49

#### Usage

Lifespan

### Format

A data frame/tibble with six observations two variables

heat temperature (in Celcius)

life lifespan of component (in hours)

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

```
plot(life ~ heat, data = Lifespan)
model <- lm(life ~ heat, data = Lifespan)
abline(model, col = "red")
resid(model)
sum((resid(model))^2)
anova(model)
rm(model)</pre>
```

Ιi	gntmonth	
L T	girtilloriti	

Relationship between damage reports and deaths caused by lightning

## Description

Data for Exercise 2.6

#### Usage

Ligntmonth

### Format

A data frame/tibble with 12 observations on four variables

**month** a factor with levels 1/01/2000, 10/01/2000, 11/01/2000, 12/01/2000, 2/01/2000, 3/01/2000, 4/01/2000, 5/01/2000, 6/01/2000, 7/01/2000, 8/01/2000, and 9/01/2000

deaths number of deaths due to lightning strikes

injuries number of injuries due to lightning strikes

damage damage due to lightning strikes (in dollars)

#### Source

*Lighting Fatalities, Injuries and Damage Reports in the United States*, 1959-1994, NOAA Technical Memorandum NWS SR-193, Dept. of Commerce.

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Examples

```
plot(deaths ~ damage, data = Ligntmonth)
model = lm(deaths ~ damage, data = Ligntmonth)
abline(model, col = "red")
rm(model)
```

Lodge

Measured traffic at three prospective locations for a motor lodge

#### Description

Data for Exercise 10.33

#### Usage

Lodge

#### Format

A data frame/tibble with 45 observations on six variables

traffic a numeric vector indicating the amount of vehicles that passed a site in 1 hour

site a numeric vector with values 1, 2, and 3

ranks ranks for variable traffic
## Longtail

### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Examples

```
boxplot(traffic ~ site, data = Lodge, col = cm.colors(3))
anova(lm(traffic ~ factor(site), data = Lodge))
```

Longtail

Long-tailed distributions to illustrate Kruskal Wallis test

# Description

Data for Exercise 10.45

### Usage

Longtail

# Format

A data frame/tibble with 60 observations on three variables

score a numeric vector

group a numeric vector with values 1, 2, and 3

ranks ranks for variable score

# References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

```
boxplot(score ~ group, data = Longtail, col = heat.colors(3))
kruskal.test(score ~ factor(group), data = Longtail)
anova(lm(score ~ factor(group), data = Longtail))
```

Lowabil

## Description

Data for Example 7.18

## Usage

Lowabil

## Format

A data frame/tibble with 12 observations on three variables

pair a numeric indicator of pair

**experiment** score of the child with the experimental method

control score of the child with the standard method

# References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Examples

```
diff = Lowabil$experiment - Lowabil$control
qqnorm(diff)
qqline(diff)
shapiro.test(diff)
t.test(diff)
rm(diff)
```

Magnesiu

Magnesium concentration and distances between samples

## Description

Data for Exercise 9.9

### Usage

Magnesiu

## Malpract

# Format

A data frame/tibble with 20 observations on two variables

distance distance between samples

magnesium concentration of magnesium

## Source

Davis, J. (1986), *Statistics and Data Analysis in Geology*, 2d. Ed., John Wiley and Sons, New York, p. 146.

### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

```
plot(magnesium ~ distance, data = Magnesiu)
model = lm(magnesium ~ distance, data = Magnesiu)
abline(model, col = "red")
summary(model)
rm(model)
```

Malpract

### Amounts awarded in 17 malpractice cases

## Description

Data for Exercise 5.73

### Usage

Malpract

## Format

A data frame/tibble with 17 observations on one variable

award malpractice reward (in \$1000)

### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

# Examples

SIGN.test(Malpract\$award, conf.level = 0.90)

Manager	Advertised salaries offered general managers of major corporations
	in 1995

## Description

Data for Exercise 5.81

# Usage

Manager

# Format

A data frame/tibble with 26 observations on one variable

salary random sample of advertised annual salaries of top executives (in dollars)

# References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

```
stem(Manager$salary)
SIGN.test(Manager$salary)
```

Marked

Percent of marked cars in 65 police departments in Florida

## Description

Data for Exercise 6.100

## Usage

Marked

# Math

## Format

A data frame/tibble with 65 observations on one variable

percent percentage of marked cars in 65 Florida police departments

### Source

Law Enforcement Management and Administrative Statistics, 1993, Bureau of Justice Statistics, NCJ-148825, September 1995, p. 147-148.

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Examples

```
EDA(Marked$percent)
SIGN.test(Marked$percent, md = 60, alternative = "greater")
t.test(Marked$percent, mu = 60, alternative = "greater")
```

Math

Standardized math test scores for 30 students

# Description

Data for Exercise 1.69

## Usage

Math

### Format

A data frame/tibble with 30 observations on one variable

score scores on a standardized test for 30 tenth graders

### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

# Examples

```
stem(Math$score)
hist(Math$score, main = "Math Scores", xlab = "score", freq = FALSE)
lines(density(Math$score), col = "red")
CharlieZ <- (62 - mean(Math$score))/sd(Math$score)
CharlieZ
scale(Math$score)[which(Math$score == 62)]</pre>
```

Mathcomp	Standardized math competency for a group of entering freshmen at a
	small community college

# Description

Data for Exercise 5.26

# Usage

Mathcomp

# Format

A data frame/tibble with 31 observations one variable

score scores of 31 entering freshmen at a community college on a national standardized test

### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

# Examples

```
stem(Mathcomp$score)
EDA(Mathcomp$score)
```

Mathpro

# Description

Data for Exercise 9.24, Example 9.1, and Example 9.6

## Usage

Mathpro

### Format

A data frame/tibble with 51 observations on four variables

state a factor with levels Conn, D.C., Del, Ga, Hawaii, Ind, Maine, Mass, Md, N.C., N.H., N.J., N.Y., Ore, Pa, R.I., S.C., Va, and Vt

sat\_math SAT math scores for high school seniors

**profic** math proficiency scores for eight graders

group a numeric vector

# Source

National Assessment of Educational Progress and The College Board.

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

```
model <- lm(sat_math ~ profic, data = Mathpro)
plot(sat_math ~ profic, data = Mathpro, ylab = "SAT", xlab = "proficiency")
abline(model, col = "red")
summary(model)
rm(model)</pre>
```

Maze

# Description

Data for Exercise 10.13

## Usage

Maze

# Format

A data frame/tibble with 32 observations on two variables

score error scores for animals running through a maze under different conditions

condition a factor with levels CondA, CondB, CondC, and CondD

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Examples

boxplot(score ~ condition, data = Maze, col = rainbow(4))
anova(lm(score ~ condition, data = Maze))

Median

Illustrates test of equality of medians with the Kruskal Wallis test

### Description

Data for Exercise 10.52

## Usage

Median

## Format

A data frame/tibble with 45 observations on two variables

sample a vector with values Sample1, Sample 2, and Sample 3

value a numeric vector

## Mental

# References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

# Examples

```
boxplot(value ~ sample, data = Median, col = rainbow(3))
anova(lm(value ~ sample, data = Median))
kruskal.test(value ~ factor(sample), data = Median)
```

Mental

# Median mental ages of 16 girls

## Description

Data for Exercise 6.52

# Usage

Mental

# Format

A data frame/tibble with 16 observations on one variable

age mental age of 16 girls

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

SIGN.test(Mental\$age, md = 100)

Mercury

### Description

Data for Example 1.9

## Usage

Mercury

# Format

A data frame/tibble with 25 observations on one variable

mercury a numeric vector measuring mercury (in parts per million)

# References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

# Examples

stem(Mercury\$mercury)

Metrent

Monthly rental costs in metro areas with 1 million or more persons

# Description

Data for Exercise 5.117

### Usage

Metrent

### Format

A data frame/tibble with 46 observations on one variable

rent monthly rent in dollars

### Source

U.S. Bureau of the Census, *Housing in the Metropolitan Areas, Statistical Brief* SB/94/19, September 1994.

## Miller

# References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Examples

boxplot(Metrent\$rent, col = "magenta")
t.test(Metrent\$rent, conf.level = 0.99)\$conf

Miller	Miller personality test scores for a group of college students applying
	for graduate school

# Description

Data for Example 5.7

# Usage

Miller

### Format

A data frame/tibble with 25 observations on one variable

miller scores on the Miller Personality test

# References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

```
stem(Miller$miller)
fivenum(Miller$miller)
boxplot(Miller$miller)
qqnorm(Miller$miller,col = "blue")
qqline(Miller$miller, col = "red")
```

Miller1

# Description

Data for Exercise 1.41

## Usage

Miller1

### Format

A data frame/tibble with 20 observations on one variable

miller scores on the Miller personality test

# References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

stem(Miller1\$miller)
stem(Miller1\$miller, scale = 2)

Moisture	Moisture content and depth of core sample for marine muds in eastern
	Louisiana

# Description

Data for Exercise 9.32

### Usage

Moisture

# Format

A data frame/tibble with 16 observations on four variables

depth a numeric vector

moisture g of water per 100 g of dried sediment

Inmoist a numeric vector

depthsq a numeric vector

### Monoxide

### Source

Davis, J. C. (1986), *Statistics and Data Analysis in Geology*, 2d. ed., John Wiley and Sons, New York, pp. 177, 185.

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

# Examples

```
plot(moisture ~ depth, data = Moisture)
model <- lm(moisture ~ depth, data = Moisture)
abline(model, col = "red")
plot(resid(model) ~ depth, data = Moisture)
rm(model)</pre>
```

Monoxide	Carbon monoxide emitted by smoke stacks of a manufacturer and a
	competitor

### Description

Data for Exercise 7.45

# Usage

Monoxide

### Format

A data frame/tibble with ten observations on two variables

company a vector with values manufacturer and competitor

emission carbon monoxide emitted

### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

## End(Not run)

Movie

Moral attitude scale on 15 subjects before and after viewing a movie

# Description

Data for Exercise 7.53

### Usage

Movie

## Format

A data frame/tibble with 12 observations on three variables

before moral aptitude before viewing the movie

after moral aptitude after viewing the movie

differ a numeric vector

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Examples

```
qqnorm(Movie$differ)
qqline(Movie$differ)
shapiro.test(Movie$differ)
t.test(Movie$differ, conf.level = 0.99)
wilcox.test(Movie$differ)
```

Music

Improvement scores for identical twins taught music recognition by two techniques

# Description

Data for Exercise 7.59

## Usage

Music

# Format

A data frame/tibble with 12 observations on three variables

method1 a numeric vector measuring the improvement scores on a music recognition test

method2 a numeric vector measuring the improvement scores on a music recognition test

differ method1 - method2

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Examples

## End(Not run)

Name

# Description

Data for Exercises 2.28, 9.19, and Example 2.8

### Usage

Name

### Format

A data frame/tibble with 42 observations on three variables

brand a factor with levels Band-Aid, Barbie, Birds Eye, Budweiser, Camel, Campbell, Carlsberg, Coca-Cola, Colgate, Del Monte, Fisher-Price, Gordon's, Green Giant, Guinness, Haagen-Dazs, Heineken, Heinz, Hennessy, Hermes, Hershey, Ivory, Jell-o, Johnnie Walker, Kellogg, Kleenex, Kraft, Louis Vuitton, Marlboro, Nescafe, Nestle, Nivea, Oil of Olay, Pampers, Pepsi-Cola, Planters, Quaker, Sara Lee, Schweppes, Smirnoff, Tampax, Winston, and Wrigley's

value value in billions of dollars

revenue revenue in billions of dollars

### Source

Financial World.

### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

```
plot(value ~ revenue, data = Name)
model <- lm(value ~ revenue, data = Name)
abline(model, col = "red")
cor(Name$value, Name$revenue)
summary(model)
rm(model)</pre>
```

Nascar

## Description

Data for Exercise 10.53

# Usage

Nascar

## Format

A data frame/tibble with 36 observations on six variables

time duration of pit stop (in seconds)

team a numeric vector representing team 1, 2, or 3

ranks a numeric vector ranking each pit stop in order of speed

# References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

# Examples

```
boxplot(time ~ team, data = Nascar, col = rainbow(3))
model <- lm(time ~ factor(team), data = Nascar)
summary(model)
anova(model)
rm(model)</pre>
```

Reaction effects of 4 drugs on 25 subjects with a nervous disorder

## Description

Data for Example 10.3

### Usage

Nervous

Newsstand

# Format

A data frame/tibble with 25 observations on two variables

react a numeric vector representing reaction time

drug a numeric vector indicating each of the 4 drugs

# References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

```
boxplot(react ~ drug, data = Nervous, col = rainbow(4))
model <- aov(react ~ factor(drug), data = Nervous)
summary(model)
TukeyHSD(model)
plot(TukeyHSD(model), las = 1)</pre>
```

Newsstand

Daily profits for 20 newsstands

# Description

Data for Exercise 1.43

### Usage

Newsstand

### Format

A data frame/tibble with 20 observations on one variable

profit profit of each newsstand (in dollars)

### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

# Examples

```
stem(Newsstand$profit)
stem(Newsstand$profit, scale = 3)
```

Nfldraf2

Rating, time in 40-yard dash, and weight of top defensive linemen in the 1994 NFL draft

### Description

Data for Exercise 9.63

## Usage

Nfldraf2

## Format

A data frame/tibble with 47 observations on three variables

rating rating of each player on a scale out of 10

forty forty yard dash time (in seconds)

weight weight of each player (in pounds)

# References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

# Examples

```
plot(rating ~ forty, data = Nfldraf2)
summary(lm(rating ~ forty, data = Nfldraf2))
```

Nfldraft	Rating, time in 40-yard dash, and weight of top offensive linemen in
	the 1994 NFL draft

# Description

Data for Exercises 9.10 and 9.16

### Usage

Nfldraft

## Nicotine

## Format

A data frame/tibble with 29 observations on three variables

rating rating of each player on a scale out of 10

forty forty yard dash time (in seconds)

weight weight of each player (in pounds)

### Source

USA Today, April 20, 1994.

### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

# Examples

```
plot(rating ~ forty, data = Nfldraft)
cor(Nfldraft$rating, Nfldraft$forty)
summary(lm(rating ~ forty, data = Nfldraft))
```

Nicotine

Nicotine content versus sales for eight major brands of cigarettes

### Description

Data for Exercise 9.21

### Usage

Nicotine

### Format

A data frame/tibble with eight observations on two variables

nicotine nicotine content (in milligrams)

sales sales figures (in \$100,000)

### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## normarea

# Examples

normarea

Normal Area

# Description

Function that computes and draws the area between two user specified values in a user specified normal distribution with a given mean and standard deviation

## Usage

```
normarea(lower = -Inf, upper = Inf, m, sig)
```

# Arguments

lower	the lower value
upper	the upper value
m	the mean for the population
sig	the standard deviation of the population

## Author(s)

Alan T. Arnholt

```
normarea(70, 130, 100, 15)
# Finds and P(70 < X < 130) given X is N(100,15).
```

nsize

### Description

Function to determine required sample size to be within a given margin of error.

### Usage

nsize(b, sigma = NULL, p = 0.5, conf.level = 0.95, type = "mu")

### Arguments

b	the desired bound.
sigma	population standard deviation. Not required if using type "pi".
р	estimate for the population proportion of successes. Not required if using type "mu".
conf.level	confidence level for the problem, restricted to lie between zero and one.
type	character string, one of "mu" or "pi", or just the initial letter of each, indicating the appropriate parameter. Default value is "mu".

## Details

Answer is based on a normal approximation when using type "pi".

### Value

Returns required sample size.

### Author(s)

Alan T. Arnholt

```
nsize(b=.03, p=708/1200, conf.level=.90, type="pi")
# Returns the required sample size (n) to estimate the population
# proportion of successes with a 0.9 confidence interval
# so that the margin of error is no more than 0.03 when the
# estimate of the population propotion of successes is 708/1200.
# This is problem 5.38 on page 257 of Kitchen's BSDA.
nsize(b=.15, sigma=.31, conf.level=.90, type="mu")
# Returns the required sample size (n) to estimate the population
# mean with a 0.9 confidence interval so that the margin
# of error is no more than 0.15. This is Example 5.17 on page
# 261 of Kitchen's BSDA.
```

ntester

## Description

Q-Q plots of randomly generated normal data of the same size as the tested data are generated and ploted on the perimeter of the graph while a Q-Q plot of the actual data is depicted in the center of the graph.

### Usage

ntester(actual.data)

### Arguments

actual.data a numeric vector. Missing and infinite values are allowed, but are ignored in the calculation. The length of actual.data must be less than 5000 after dropping nonfinite values.

## Details

Q-Q plots of randomly generated normal data of the same size as the tested data are generated and ploted on the perimeter of the graph sheet while a Q-Q plot of the actual data is depicted in the center of the graph. The p-values are calculated form the Shapiro-Wilk W-statistic. Function will only work on numeric vectors containing less than or equal to 5000 observations.

### Author(s)

Alan T. Arnholt

### References

Shapiro, S.S. and Wilk, M.B. (1965). An analysis of variance test for normality (complete samples). Biometrika **52** : 591-611.

### Examples

```
ntester(rexp(50,1))
```

 $\ensuremath{\texttt{\#}}\xspace \mathsf{Q}\xspace \mathsf{Q}$  plot of random exponential data in center plot

# surrounded by 8 Q-Q plots of randomly generated

# standard normal data of size 50.

Orange

# Description

Data for Exercise 9.61

## Usage

Orange

# Format

A data frame/tibble with six observations on two variables

harvest harvest in millions of boxes

price average price charged by California growers for a 75-pound box of navel oranges

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

```
plot(price ~ harvest, data = Orange)
model <- lm(price ~ harvest, data = Orange)
abline(model, col = "red")
summary(model)
rm(model)</pre>
```

Orioles

Salaries of members of the Baltimore Orioles baseball team

# Description

Data for Example 1.3

### Usage

Orioles

## Oxytocin

### Format

A data frame/tibble with 27 observations on three variables

- first name a factor with levels Albert, Arthur, B.J., Brady, Cal, Charles, dl-Delino, dl-Scott, Doug, Harold, Heathcliff, Jeff, Jesse, Juan, Lenny, Mike, Rich, Ricky, Scott, Sidney, Will, and Willis
- last name a factor with levels Amaral, Anderson, Baines, Belle, Bones, Bordick, Clark, Conine, Deshields, Erickson, Fetters, Garcia, Guzman, Johns, Johnson, Kamieniecki, Mussina, Orosco, Otanez, Ponson, Reboulet, Rhodes, Ripken Jr., Slocumb, Surhoff, Timlin, and Webster

**1999salary** a numeric vector containing each player's salary (in dollars)

### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Examples

```
stripchart(Orioles$`1999salary`, method = "stack", pch = 19)
## Not run:
library(ggplot2)
ggplot2::ggplot(data = Orioles, aes(x = `1999salary`)) +
        geom_dotplot(dotsize = 0.5) +
        labs(x = "1999 Salary") +
        theme_bw()
```

## End(Not run)

Oxytocin

Arterial blood pressure of 11 subjects before and after receiving oxytocin

### Description

Data for Exercise 7.86

### Usage

Oxytocin

## Format

A data frame/tibble with 11 observations on three variables

subject a numeric vector indicating each subject

before mean arterial blood pressure of subject before receiving oxytocin

after mean arterial blood pressure of subject after receiving oxytocin

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Examples

```
diff = Oxytocin$after - Oxytocin$before
qqnorm(diff)
qqline(diff)
shapiro.test(diff)
t.test(diff)
rm(diff)
```

Parented	Education backgrounds of parents of entering freshmen at a state uni-
	versity

### Description

Data for Exercise 1.32

### Usage

Parented

### Format

A data frame/tibble with 200 observations on two variables

education a factor with levels 4yr college degree, Doctoral degree, Grad degree, H.S grad or less, Some college, and Some grad school

parent a factor with levels mother and father

### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Examples

```
T1 <- xtabs(~education + parent, data = Parented)
T1
barplot(t(T1), beside = TRUE, legend = TRUE, col = c("blue", "red"))
rm(T1)
## Not run:

ggplot2::ggplot(data = Parented, aes(x = education, fill = parent)) +
    geom_bar(position = "dodge") +</pre>
```

# Patrol

```
theme_bw() +
theme(axis.text.x = element_text(angle = 85, vjust = 0.5)) +
scale_fill_manual(values = c("pink", "blue")) +
labs(x = "", y = "")
```

## End(Not run)

Patrol

Years of experience and number of tickets given by patrolpersons in New York City

# Description

Data for Example 9.3

# Usage

Patrol

### Format

A data frame/tibble with ten observations on three variables

tickets number of tickets written per week

years patrolperson's experience (in years)

log\_tickets natural log of tickets

# References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

```
model <- lm(tickets ~ years, data = Patrol)
summary(model)
confint(model, level = 0.98)</pre>
```

Pearson

## Description

Data for Exercise 2.20

## Usage

Pearson

# Format

A data frame/tibble with 11 observations on three variables

family number indicating family of brother and sister pair

brother height of brother (in inches)

sister height of sister (in inches)

## Source

Pearson, K. and Lee, A. (1902-3), On the Laws of Inheritance in Man, Biometrika, 2, 357.

### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Examples

plot(brother ~ sister, data = Pearson, col = "lightblue")
cor(Pearson\$brother, Pearson\$sister)

Phone

Length of long-distance phone calls for a small business firm

### Description

Data for Exercise 6.95

### Usage

Phone

## Poison

# Format

A data frame/tibble with 20 observations on one variable

time duration of long distance phone call (in minutes)

### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Examples

```
qqnorm(Phone$time)
qqline(Phone$time)
shapiro.test(Phone$time)
SIGN.test(Phone$time, md = 5, alternative = "greater")
```

Poison

Number of poisonings reported to 16 poison control centers

## Description

Data for Exercise 1.113

### Usage

Poison

# Format

A data frame/tibble with 226,361 observations on one variable

type a factor with levels Alcohol, Cleaning agent, Cosmetics, Drugs, Insecticides, and Plants

### Source

Centers for Disease Control, Atlanta, Georgia.

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Examples

## End(Not run)

Politic

Political party and gender in a voting district

## Description

Data for Example 8.3

### Usage

Politic

### Format

A data frame/tibble with 250 observations on two variables

party a factor with levels republican, democrat, and other

gender a factor with levels female and male

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Examples

```
T1 <- xtabs(~party + gender, data = Politic)
T1
chisq.test(T1)
rm(T1)</pre>
```

Pollutio

# Description

Data for Exercise 5.59

# Usage

Pollutio

## Format

A data frame/tibble with 15 observations on one variable

inde air pollution index

# References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

stem(Pollutio\$inde)
t.test(Pollutio\$inde, conf.level = 0.98)\$conf

Porosity	Porosity measurements on 20 samples of Tensleep Sandstone, Pennsyl-
	vanian from Bighorn Basin in Wyoming

# Description

Data for Exercise 5.86

### Usage

Porosity

# Format

A data frame/tibble with 20 observations on one variable

porosity porosity measurement (percent)

## Source

Davis, J. C. (1986), Statistics and Data Analysis in Geology, 2nd edition, pages 63-65.

### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

```
stem(Porosity$porosity)
fivenum(Porosity$porosity)
boxplot(Porosity$porosity, col = "lightgreen")
```

Poverty

Percent poverty and crime rate for selected cities

## Description

Data for Exercise 9.11 and 9.17

### Usage

Poverty

## Format

A data frame/tibble with 20 observations on four variables

city a factor with levels Atlanta, Buffalo, Cincinnati, Cleveland, Dayton, O, Detroit, Flint, Mich, Fresno, C, Gary, Ind, Hartford, C, Laredo, Macon, Ga, Miami, Milwaukee, New Orleans, Newark, NJ, Rochester, NY, Shreveport, St. Louis, and Waco, Tx

poverty percent of children living in poverty

crime crime rate (per 1000 people)

population population of city

### Source

Children's Defense Fund and the Bureau of Justice Statistics.

### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Precinct

# Examples

```
plot(poverty ~ crime, data = Poverty)
model <- lm(poverty ~ crime, data = Poverty)
abline(model, col = "red")
summary(model)
rm(model)</pre>
```

Precinct

Robbery rates versus percent low income in eight precincts

# Description

Data for Exercise 2.2 and 2.38

# Usage

Precinct

### Format

A data frame/tibble with eight observations on two variables

rate robbery rate (per 1000 people)

income percent with low income

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

```
plot(rate ~ income, data = Precinct)
model <- (lm(rate ~ income, data = Precinct))
abline(model, col = "red")
rm(model)</pre>
```

Prejudic

# Description

Data for Exercise 5.10 and 5.22

## Usage

Prejudic

# Format

A data frame with 25 observations on one variable

prejud racial prejudice score

# References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

# Examples

stem(Prejudic\$prejud)
EDA(Prejudic\$prejud)

Presiden

Ages at inauguration and death of U.S. presidents

# Description

Data for Exercise 1.126

## Usage

Presiden

Press

## Format

A data frame/tibble with 43 observations on five variables

- $\label{eq:initial} first\_initial \ a \ factor \ with \ levels \ A., B., C., D., F., G., G. W., H., J., L., M., R., T., U., W., and Z.$
- last\_name a factor with levels Adams, Arthur, Buchanan, Bush, Carter, Cleveland, Clinton, Coolidge, Eisenhower, Fillmore, Ford, Garfield, Grant, Harding, Harrison, Hayes, Hoover, Jackson, Jefferson, Johnson, Kennedy, Lincoln, Madison, McKinley, Monroe, Nixon, Pierce, Polk, Reagan, Roosevelt, Taft, Taylor, Truman, Tyler, VanBuren, Washington, and Wilson
- **birth\_state** a factor with levels ARK, CAL, CONN, GA, IA, ILL, KY, MASS, MO, NC, NEB, NH, NJ, NY, OH, PA, SC, TEX, VA, and VT

inaugural\_age President's age at inauguration

death\_age President's age at death

### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

Press	Degree of confidence in the press versus education level for 20 ran-
	domly selected persons

## Description

Data for Exercise 9.55

## Usage

Press

## Format

A data frame/tibble with 20 observations on two variables

education\_yrs years of education

confidence degree of confidence in the press (the higher the score, the more confidence)

### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Examples

```
plot(confidence ~ education_yrs, data = Press)
model <- lm(confidence ~ education_yrs, data = Press)
abline(model, col = "purple")
summary(model)
rm(model)</pre>
```

Prognost	Klopfer's prognostic rating scale for subjects receiving behavior mod-
	ification therapy

## Description

Data for Exercise 6.61

### Usage

Prognost

## Format

A data frame/tibble with 15 observations on one variable

kprs\_score Kloper's Prognostic Rating Scale score

## Source

Newmark, C., et al. (1973), Predictive Validity of the Rorschach Prognostic Rating Scale with Behavior Modification Techniques, *Journal of Clinical Psychology*, 29, 246-248.

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Examples

```
EDA(Prognost$kprs_score)
t.test(Prognost$kprs_score, mu = 9)
```
Program

# Description

Data for Exercise 10.17

#### Usage

Program

## Format

A data frame/tibble with 44 observations on two variables

method a character variable with values method1, method2, method3, and method4

score standardized test score

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

```
boxplot(score ~ method, col = c("red", "blue", "green", "yellow"), data = Program)
anova(lm(score ~ method, data = Program))
TukeyHSD(aov(score ~ method, data = Program))
par(mar = c(5.1, 4.1 + 4, 4.1, 2.1))
plot(TukeyHSD(aov(score ~ method, data = Program)), las = 1)
par(mar = c(5.1, 4.1, 4.1, 2.1))
```

Psat

## PSAT scores versus SAT scores

### Description

Data for Exercise 2.50

#### Usage

Psat

# Format

A data frame/tibble with seven observations on the two variables

psat PSAT score

sat SAT score

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

# Examples

```
model <- lm(sat ~ psat, data = Psat)
par(mfrow = c(1, 2))
plot(Psat$psat, resid(model))
plot(model, which = 1)
rm(model)
par(mfrow = c(1, 1))</pre>
```

Psych

Correct responses for 24 students in a psychology experiment

# Description

Data for Exercise 1.42

## Usage

Psych

# Format

A data frame/tibble with 23 observations on one variable

score number of correct repsonses in a psychology experiment

# References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

# Examples

stem(Psych\$score)
EDA(Psych\$score)

Puerto

# Description

Data for Exercise 5.22 and 5.65

## Usage

Puerto

#### Format

A data frame/tibble with 50 observations on one variable

income weekly family income (in dollars)

# References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

#### Examples

stem(Puerto\$income)
boxplot(Puerto\$income, col = "purple")
t.test(Puerto\$income,conf.level = .90)\$conf

Quail

Plasma LDL levels in two groups of quail

## Description

Data for Exercise 1.53, 1.77, 1.88, 5.66, and 7.50

#### Usage

Quail

## Format

A data frame/tibble with 40 observations on two variables

group a character variable with values placebo and treatment

level low-density lipoprotein (LDL) cholestrol level

#### Source

J. McKean, and T. Vidmar (1994), "A Comparison of Two Rank-Based Methods for the Analysis of Linear Models," *The American Statistician, 48*, 220-229.

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

#### Examples

Oua		1. V

Quality control test scores on two manufacturing processes

# Description

Data for Exercise 7.81

# Usage

Quality

# Format

A data frame/tibble with 15 observations on two variables

process a character variable with values Process1 and Process2

score results of a quality control test

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

```
boxplot(score ~ process, data = Quality, col = "lightgreen")
t.test(score ~ process, data = Quality)
```

Rainks

# Description

Data for Exercise 9.8

# Usage

Rainks

## Format

A data frame/tibble with 35 observations on five variables

rain rainfall (in inches)

- x1 rainfall (in inches)
- x2 rainfall (in inches)
- x3 rainfall (in inches)
- x4 rainfall (in inches)

# Source

R. Picard, K. Berk (1990), Data Splitting, The American Statistician, 44, (2), 140-147.

# References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

# Examples

```
cor(Rainks)
model <- lm(rain ~ x2, data = Rainks)
summary(model)</pre>
```

Randd

## Description

Data for Exercise 9.36 and Example 9.8

# Usage

Randd

# Format

A data frame/tibble with 12 observations on two variables

rd research and development expenditures (in million dollars)

sales sales (in million dollars)

# References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

# Examples

```
plot(sales ~ rd, data = Randd)
model <- lm(sales ~ rd, data = Randd)
abline(model, col = "purple")
summary(model)
plot(model, which = 1)
rm(model)</pre>
```

Rat

Survival times of 20 rats exposed to high levels of radiation

## Description

Data for Exercise 1.52, 1.76, 5.62, and 6.44

#### Usage

Rat

## Ratings

# Format

A data frame/tibble with 20 observations on one variable

survival\_time survival time in weeks for rats exposed to a high level of radiation

## Source

J. Lawless, Statistical Models and Methods for Lifetime Data (New York: Wiley, 1982).

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

#### Examples

```
hist(Rat$survival_time)
qqnorm(Rat$survival_time)
qqline(Rat$survival_time)
summary(Rat$survival_time)
t.test(Rat$survival_time)
t.test(Rat$survival_time, mu = 100, alternative = "greater")
```

Ratings

Grade point averages versus teacher's ratings

#### Description

Data for Example 2.6

## Usage

Ratings

### Format

A data frame/tibble with 250 observations on two variables

rating character variable with students' ratings of instructor (A-F)

gpa students' grade point average

### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

```
boxplot(gpa ~ rating, data = Ratings, xlab = "Student rating of instructor",
        ylab = "Student GPA")
## Not run:
library(ggplot2)
ggplot2::ggplot(data = Ratings, aes(x = rating, y = gpa, fill = rating)) +
        geom_boxplot() +
        theme_bw() +
        theme(legend.position = "none") +
        labs(x = "Student rating of instructor", y = "Student GPA")
```

## End(Not run)

Reaction

*Threshold reaction time for persons subjected to emotional stress* 

# Description

Data for Example 6.11

#### Usage

Reaction

## Format

A data frame/tibble with 12 observations on one variable

time threshold reaction time (in seconds) for persons subjected to emotional stress

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

```
stem(Reaction$time)
SIGN.test(Reaction$time, md = 15, alternative = "less")
```

Reading

# Description

Data for Exercise 1.72 and 2.10

## Usage

Reading

## Format

A data frame/tibble with 30 observations on four variables

score standardized reading test score

**sorted** sorted values of score

trimmed trimmed values of sorted

winsoriz winsorized values of score

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Examples

Readiq

# Reading scores versus IQ scores

# Description

Data for Exercises 2.10 and 2.53

#### Usage

Readiq

## Referend

#### Format

A data frame/tibble with 14 observations on two variables

reading reading achievement score

iq IQ score

# References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

# Examples

```
plot(reading ~ iq, data = Readiq)
model <- lm(reading ~ iq, data = Readiq)
abline(model, col = "purple")
predict(model, newdata = data.frame(iq = c(100, 120)))
residuals(model)[c(6, 7)]
rm(model)</pre>
```

Referend

Opinion on referendum by view on freedom of the press

## Description

Data for Exercise 8.20

#### Usage

Referend

# Format

A data frame with 237 observations on two variables

choice a factor with levels A, B, and C

response a factor with levels for, against, and undecided

# References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Region

# Examples

```
T1 <- xtabs(~choice + response, data = Referend)
T1
chisq.test(T1)
chisq.test(T1)$expected</pre>
```

Region

Pollution index taken in three regions of the country

# Description

Data for Exercise 10.26

## Usage

Region

## Format

A data frame/tibble with 48 observations on three variables

pollution pollution index

region region of a county (west, central, and east)

ranks ranked values of pollution

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

# Examples

```
boxplot(pollution ~ region, data = Region, col = "gray")
anova(lm(pollution ~ region, data = Region))
```

Register

# Description

Data for Exercise 2.3, 2.39, and 2.54

#### Usage

Register

## Format

A data frame/tibble with nine observations on two variables

age age of cash register (in years)

cost maintenance cost of cash register (in dollars)

# References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

# Examples

```
plot(cost ~ age, data = Register)
model <- lm(cost ~ age, data = Register)
abline(model, col = "red")
predict(model, newdata = data.frame(age = c(5, 10)))
plot(model, which = 1)
rm(model)</pre>
```

Rehab	Rehabilitative potential of 20 prison inmates as judged by two psychi-
	atrists

# Description

Data for Exercise 7.61

#### Usage

Rehab

## Remedial

# Format

A data frame/tibble with 20 observations on four variables

inmate inmate identification number

psych1 rating from first psychiatrist on the inmates rehabilative potential

psych2 rating from second psychiatrist on the inmates rehabilative potential

differ psych1 - psych2

# References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

```
boxplot(Rehab$differ)
qqnorm(Rehab$differ)
qqline(Rehab$differ)
t.test(Rehab$differ)
```

Remedial	Math placement test score for 35 freshmen females and 42 freshmen
	males

# Description

Data for Exercise 7.43

#### Usage

Remedial

# Format

A data frame/tibble with 84 observations on two variables

gender a character variable with values female and male

score math placement score

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

# Examples

Rentals

#### Weekly rentals for 45 apartments

## Description

Data for Exercise 1.122

## Usage

Rentals

#### Format

A data frame/tibble with 45 observations on one variable

rent weekly apartment rental price (in dollars)

# References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

# Examples

```
stem(Rentals$rent)
sum(Rentals$rent < mean(Rentals$rent) - 3*sd(Rentals$rent) |
Rentals$rent > mean(Rentals$rent) + 3*sd(Rentals$rent))
```

Repair

# Description

Data for Exercise 5.77

## Usage

Repair

# Format

A data frame/tibble with 22 observations on one variable

time time to repair a wrecked in car (in hours)

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

stem(Repair\$time)
SIGN.test(Repair\$time, conf.level = 0.98)

Retail	Length of employment versus gross sales for 10 employees of a	ı large
	retail store	

# Description

Data for Exercise 9.59

## Usage

Retail

# Format

A data frame/tibble with 10 observations on two variables

months length of employment (in months)

sales employee gross sales (in dollars)

### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

#### Examples

```
plot(sales ~ months, data = Retail)
model <- lm(sales ~ months, data = Retail)
abline(model, col = "blue")
summary(model)</pre>
```

Ronbrown1	Oceanography data obtained at site 1 by scientist aboard the ship Ron
	Brown

## Description

Data for Exercise 2.9

#### Usage

Ronbrown1

# Format

A data frame/tibble with 75 observations on two variables

depth ocen depth (in meters)

temperature ocean temperature (in Celsius)

# References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

# Examples

plot(temperature ~ depth, data = Ronbrown1, ylab = "Temperature")

Ronbrown2

## Description

Data for Exercise 2.56 and Example 2.4

#### Usage

Ronbrown2

## Format

A data frame/tibble with 150 observations on three variables

depth ocean depth (in meters)

temperature ocean temperature (in Celcius)

salinity ocean salinity level

# References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

```
plot(salinity ~ depth, data = Ronbrown2)
model <- lm(salinity ~ depth, data = Ronbrown2)
summary(model)
plot(model, which = 1)
rm(model)</pre>
```

Rural

Social adjustment scores for a rural group and a city group of children

# Description

Data for Example 7.16

#### Usage

Rural

Salary

## Format

A data frame/tibble with 33 observations on two variables

**score** child's social adjustment score **area** character variable with values city and rural

### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

### Examples

```
boxplot(score ~ area, data = Rural)
wilcox.test(score ~ area, data = Rural)
## Not run:
library(dplyr)
Rural <- dplyr::mutate(Rural, r = rank(score))
Rural
t.test(r ~ area, data = Rural)
## End(Not run)</pre>
```

Salary

Starting salaries for 25 new PhD psychologist

#### Description

Data for Exercise 3.66

#### Usage

Salary

## Format

A data frame/tibble with 25 observations on one variable

salary starting salary for Ph.D. psycholgists (in dollars)

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

# Examples

```
qqnorm(Salary$salary, pch = 19, col = "purple")
qqline(Salary$salary, col = "blue")
```

Salinity

# Description

Data for Exercise 5.27 and 5.64

## Usage

Salinity

## Format

A data frame/tibble with 48 observations on one variable

salinity surface-water salinity value

## Source

J. Davis, Statistics and Data Analysis in Geology, 2nd ed. (New York: John Wiley, 1986).

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

#### Examples

```
stem(Salinity$salinity)
qqnorm(Salinity$salinity, pch = 19, col = "purple")
qqline(Salinity$salinity, col = "blue")
t.test(Salinity$salinity, conf.level = 0.99)
t.test(Salinity$salinity, conf.level = 0.99)$conf
```

Sat

SAT scores, percent taking exam and state funding per student by state for 1994, 1995 and 1999

## Description

Data for Statistical Insight Chapter 9

#### Usage

Sat

## Format

A data frame/tibble with 102 observations on seven variables

state U.S. state
verbal verbal SAT score
math math SAT score
total combined verbal and math SAT score
percent percent of high school seniors taking the SAT
expend state expenditure per student (in dollars)
year year

# Source

The 2000 World Almanac and Book of Facts, Funk and Wagnalls Corporation, New Jersey.

# References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

#### Examples

```
Sat94 <- Sat[Sat$year == 1994, ]
Sat94
Sat99 <- subset(Sat, year == 1999)
Sat99
stem(Sat99$total)
plot(total ~ percent, data = Sat99)
model <- lm(total ~ percent, data = Sat99)
abline(model, col = "blue")
summary(model)
rm(model)</pre>
```

Saving	Problem asset ration for savings and loan companies in California,
	New York, and Texas

## Description

Data for Exercise 10.34 and 10.49

#### Usage

Saving

Scales

## Format

A data frame/tibble with 65 observations on two variables

par problem-asset-ratio for Savings & Loans that were listed as being financially troubled in 1992state U.S. state

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

#### Examples

```
boxplot(par ~ state, data = Saving, col = "red")
boxplot(par ~ state, data = Saving, log = "y", col = "red")
model <- aov(par ~ state, data = Saving)
summary(model)
plot(TukeyHSD(model))
kruskal.test(par ~ factor(state), data = Saving)
```

Scales	Readings obtained from a 100 pound weight placed on four brands of
	bathroom scales

# Description

Data for Exercise 1.89

#### Usage

Scales

# Format

A data frame/tibble with 20 observations on two variables

brand variable indicating brand of bathroom scale (A, B, C, or D)

reading recorded value (in pounds) of a 100 pound weight

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

```
boxplot(reading ~ brand, data = Scales, col = rainbow(4),
ylab = "Weight (lbs)")

Schizop2	Exam	scores	for	17	patients	to	assess	the	learning	ability	of
	schizoj	phrenics	s afte	r tal	king a spe	cifi	ed does	of a i	tranquilize	?r	

# Description

Data for Exercise 6.99

## Usage

Schizop2

## Format

A data frame/tibble with 17 observations on one variable

score schizophrenics score on a second standardized exam

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

# Examples

```
hist(Schizop2$score, xlab = "score on standardized test after a tranquilizer",
main = "Exercise 6.99", breaks = 10, col = "orange")
EDA(Schizop2$score)
SIGN.test(Schizop2$score, md = 22, alternative = "greater")
```

Schizoph

## Description

Data for Example 6.10

# Usage

Schizoph

# Format

A data frame/tibble with 13 observations on one variable

**score** schizophrenics score on a standardized exam one hour after recieving a specified dose of a tranqilizer.

### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

#### Examples

```
hist(Schizoph$score, xlab = "score on standardized test",
main = "Example 6.10", breaks = 10, col = "orange")
EDA(Schizoph$score)
t.test(Schizoph$score, mu = 20)
```

Seatbelt

Injury level versus seatbelt usage

## Description

Data for Exercise 8.24

#### Usage

Seatbelt

## Format

A data frame/tibble with 86,759 observations on two variables

seatbelt a factor with levels No and Yes

injuries a factor with levels None, Minimal, Minor, or Major indicating the extent of the drivers injuries

# Source

Jobson, J. (1982), Applied Multivariate Data Analysis, Springer-Verlag, New York, p. 18.

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

```
T1 <- xtabs(~seatbelt + injuries, data = Seatbelt)
T1
chisq.test(T1)
rm(T1)</pre>
```

Selfdefe	Self-confidence scores for 9 women before and after instructions on
	self-defense

## Description

Data for Example 7.19

#### Usage

Selfdefe

# Format

A data frame/tibble with nine observations on three variables

woman number identifying the woman

before before the course self-confidence score

after after the course self-confidence score

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Senior

# Examples

```
Selfdefe$differ <- Selfdefe$after - Selfdefe$before
Selfdefe
t.test(Selfdefe$differ, alternative = "greater")</pre>
```

Senior

Reaction times of 30 senior citizens applying for drivers license renewals

# Description

Data for Exercise 1.83 and 3.67

### Usage

Senior

# Format

A data frame/tibble with 31 observations on one variable

reaction reaction time for senior citizens applying for a driver's license renewal

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

Sentence

#### Description

Data for Exercise 1.123

## Usage

Sentence

# Format

A data frame/tibble with 41 observations on one variable

months sentence length (in months) for prisoners convicted of homocide

#### Source

U.S. Department of Justice, Bureau of Justice Statistics, *Prison Sentences and Time Served for Violence*, NCJ-153858, April 1995.

## References

```

Shkdrug	Effects of a drug and electroshock therapy on the ability to solve simple
	tasks

# Description

Data for Exercises 10.11 and 10.12

#### Usage

Shkdrug

## Shock

# Format

A data frame/tibble with 64 observations on two variables

treatment type of treament Drug/NoS, Drug/Shk, NoDg/NoS, or NoDrug/S

response number of tasks completed in a 10-minute period

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

```
boxplot(response ~ treatment, data = Shkdrug, col = "gray")
model <- lm(response ~ treatment, data = Shkdrug)
anova(model)
rm(model)</pre>
```

Shock

Effect of experimental shock on time to complete difficult task

## Description

Data for Exercise 10.50

## Usage

Shock

# Format

A data frame/tibble with 27 observations on two variables

**group** grouping variable with values of Group1 (no shock), Group2 (medium shock), and Group3 (severe shock)

attempts number of attempts to complete a task

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Shoplift

# Examples

```
boxplot(attempts ~ group, data = Shock, col = "violet")
model <- lm(attempts ~ group, data = Shock)
anova(model)
rm(model)</pre>
```

Shoplift

Sales receipts versus shoplifting losses for a department store

# Description

Data for Exercise 9.58

# Usage

Shoplift

#### Format

A data frame/tibble with eight observations on two variables

sales sales (in 1000 dollars)

loss loss (in 100 dollars)

# References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

# Examples

```
plot(loss ~ sales, data = Shoplift)
model <- lm(loss ~ sales, data = Shoplift)
summary(model)
rm(model)</pre>
```

Short

# Description

Data for Exercise 6.65

## Usage

Short

# Format

A data frame/tibble with 158 observations on two variables

sample sample number

parallax parallax measurements (seconds of a degree)

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

# Examples

```
hist(Short$parallax, main = "Problem 6.65",
xlab = "", col = "orange")
SIGN.test(Short$parallax, md = 8.798)
t.test(Short$parallax, mu = 8.798)
```

Shuttle	Number of people riding shuttle versus number of automobiles in the
	downtown area

## Description

Data for Exercise 9.20

#### Usage

Shuttle

# Format

A data frame/tibble with 15 observations on two variables

users number of shuttle riders

autos number of automobiles in the downtown area

# References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

```
plot(autos ~ users, data = Shuttle)
model <- lm(autos ~ users, data = Shuttle)
summary(model)
rm(model)</pre>
```

Sign Test

SIGN.test

# Description

This function will test a hypothesis based on the sign test and reports linearly interpolated confidence intervals for one sample problems.

# Usage

```
SIGN.test(
    x,
    y = NULL,
    md = 0,
    alternative = "two.sided",
    conf.level = 0.95,
    ...
)
```

# Arguments

х	numeric vector; NAs and Infs are allowed but will be removed.
у	optional numeric vector; NAs and Infs are allowed but will be removed.
md	a single number representing the value of the population median specified by
	the null hypothesis

# SIGN.test

alternative	is a character string, one of "greater", "less", or "two.sided", or the initial letter of each, indicating the specification of the alternative hypothesis. For one- sample tests, alternative refers to the true median of the parent population in relation to the hypothesized value of the median.
conf.level	confidence level for the returned confidence interval, restricted to lie between zero and one
	further arguments to be passed to or from methods

# Details

Computes a "Dependent-samples Sign-Test" if both x and y are provided. If only x is provided, computes the "Sign-Test".

## Value

A list of class htest\_S, containing the following components:

statistic	the S-statistic (the number of positive differences between the data and the hypothesized median), with names attribute "S".	
p.value	the p-value for the test	
conf.int	is a confidence interval (vector of length 2) for the true median based on linear interpolation. The confidence level is recorded in the attribute conf.level. When the alternative is not "two.sided", the confidence interval will be half-infinite, to reflect the interpretation of a confidence interval as the set of all values k for which one would not reject the null hypothesis that the true mean or difference in means is k. Here infinity will be represented by Inf.	
estimate	is avector of length 1, giving the sample median; this estimates the correspond- ing population parameter. Component estimate has a names attribute describ- ing its elements.	
null.value	is the value of the median specified by the null hypothesis. This equals the input argument md. Component null.value has a names attribute describing its elements.	
alternative	records the value of the input argument alternative: "greater", "less", or "two.sided"	
data.name	a character string (vector of length 1) containing the actual name of the input vector $\boldsymbol{x}$	
Confidence.Intervals		
	a 3 by 3 matrix containing the lower achieved confidence interval, the interpo- lated confidence interval, and the upper achived confidence interval	

## **Null Hypothesis**

For the one-sample sign-test, the null hypothesis is that the median of the population from which x is drawn is md. For the two-sample dependent case, the null hypothesis is that the median for the differences of the populations from which x and y are drawn is md. The alternative hypothesis indicates the direction of divergence of the population median for x from md (i.e., "greater", "less", "two.sided".)

# Note

The reported confidence interval is based on linear interpolation. The lower and upper confidence levels are exact.

summary(aov(mpg ~ truck, data = Trucks))
```

tsum.test

Summarized t-test

# Description

Performs a one-sample, two-sample, or a Welch modified two-sample t-test based on user supplied summary information. Output is identical to that produced with t.test.

# tsum.test

# Usage

```
tsum.test(
   mean.x,
   s.x = NULL,
   n.x = NULL,
   mean.y = NULL,
   s.y = NULL,
   n.y = NULL,
   alternative = "two.sided",
   mu = 0,
   var.equal = FALSE,
   conf.level = 0.95
)
```

# Arguments

mean.x	a single number representing the sample mean of x
s.x	a single number representing the sample standard deviation for x
n.x	a single number representing the sample size for x
mean.y	a single number representing the sample mean of y
s.y	a single number representing the sample standard deviation for y
n.y	a single number representing the sample size for y
alternative	is a character string, one of "greater", "less" or "two.sided", or just the initial letter of each, indicating the specification of the alternative hypothesis. For one-sample tests, alternative refers to the true mean of the parent population in relation to the hypothesized value mu. For the standard two-sample tests, alternative refers to the difference between the true population mean for x and that for y, in relation to mu. For the one-sample and paired t-tests, alternative refers to the difference between the true population to the hypothesized value mu. For the standard and Welch modified two-sample t-tests, alternative refers to the difference between the true population mean for x and that for y, in relation to mu. For the one-sample t-tests, alternative refers to the difference between the true population mean for x and that for y, in relation to mu. For the one-sample t-tests, alternative refers to the difference between the true population mean for x and that for y, in relation to mu. For the one-sample t-tests, alternative refers to the true mean of the parent population in relation to the hypothesized value mu. For the standard and Welch modified two-sample t-tests, alternative refers to the true population in relation to the hypothesized value mu. For the standard and Welch modified two-sample t-tests, alternative refers to the difference between the true population to the hypothesized value mu.
mu	is a single number representing the value of the mean or difference in means specified by the null hypothesis.
var.equal	logical flag: if TRUE, the variances of the parent populations of x and y are as- sumed equal. Argument var.equal should be supplied only for the two-sample tests.
conf.level	is the confidence level for the returned confidence interval; it must lie between zero and one.

250

#### tsum.test

#### Details

If y is NULL, a one-sample t-test is carried out with x. If y is not NULL, either a standard or Welch modified two-sample t-test is performed, depending on whether var.equal is TRUE or FALSE.

#### Value

A list of class htest, containing the following components:

statistic	the t-statistic, with names attribute "t"
parameters	is the degrees of freedom of the t-distribution associated with statistic. Component parameters has names attribute "df".
p.value	the p-value for the test.
conf.int	is a confidence interval (vector of length 2) for the true mean or difference in means. The confidence level is recorded in the attribute conf.level. When alternative is not "two.sided", the confidence interval will be half-infinite, to reflect the interpretation of a confidence interval as the set of all values k for which one would not reject the null hypothesis that the true mean or difference in means is k. Here infinity will be represented by Inf.
estimate	vector of length 1 or 2, giving the sample mean(s) or mean of differences; these estimate the corresponding population parameters. Component estimate has a names attribute describing its elements.
null.value	the value of the mean or difference in means specified by the null hypothesis. This equals the input argument mu. Component null.value has a names at- tribute describing its elements.
alternative	records the value of the input argument alternative: "greater", "less" or "two.sided".
data.name	a character string (vector of length 1) containing the names x and y for the two summarized samples.

#### **Null Hypothesis**

For the one-sample t-test, the null hypothesis is that the mean of the population from which x is drawn is mu. For the standard and Welch modified two-sample t-tests, the null hypothesis is that the population mean for x less that for y is mu.

The alternative hypothesis in each case indicates the direction of divergence of the population mean for x (or difference of means for x and y) from mu (i.e., "greater", "less", or "two.sided").

Vaccine

## Format

A data frame/tibble with 11 observations on two variables

state U.S. state

number number of reported serious reactions per million doses of a vaccine

## Source

Center for Disease Control, Atlanta, Georgia.

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

```
stem(Vaccine$number, scale = 2)
fn <- fivenum(Vaccine$number)
fn
iqr <- IQR(Vaccine$number)
iqr</pre>
```

Vehicle

# Description

Data for Exercise 8.34

## Usage

Vehicle

## Format

A data frame/tibble with 151 observations on two variables

make a factor with levels domestic and foreign

**rating** a factor with levels Much better than average, Above average, Average, Below average, and Much worse than average

## Source

Insurance Institute for Highway Safety and the Highway Loss Data Institute, 1995.

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

#### Examples

```
T1 <- xtabs(~make + rating, data = Vehicle)
T1
chisq.test(T1)</pre>
```

Verbal
--------

Verbal test scores and number of library books checked out for 15 eighth graders

# Description

Data for Exercise 9.30

## Usage

Verbal

Victoria

## Format

A data frame/tibble with 15 observations on two variables

number number of library books checked out

verbal verbal test score

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

```
plot(verbal ~ number, data = Verbal)
abline(lm(verbal ~ number, data = Verbal), col = "red")
summary(lm(verbal ~ number, data = Verbal))
```

Victoria	Number of sunspots versus mean annual level of Lake Victoria Nyanza
	from 1902 to 1921

## Description

Data for Exercise 2.98

#### Usage

Victoria

## Format

A data frame/tibble with 20 observations on three variables

year year

level mean annual level of Lake Victoria Nyanza

sunspot number of sunspots

#### Source

N. Shaw, *Manual of Meteorology*, Vol. 1 (London: Cambridge University Press, 1942), p. 284; and F. Mosteller and J. W. Tukey, *Data Analysis and Regression* (Reading, MA: Addison-Wesley, 1977).

#### References

### Viscosit

## Examples

```
plot(level ~ sunspot, data = Victoria)
model <- lm(level ~ sunspot, data = Victoria)
summary(model)
rm(model)</pre>
```

Viscosit

Viscosity measurements of a substance on two different days

## Description

Data for Exercise 7.44

# Usage

Viscosit

## Format

A data frame/tibble with 11 observations on two variables

first viscosity measurement for a certain substance on day one

second viscosity measurement for a certain substance on day two

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

```
boxplot(Viscosit$first, Viscosit$second, col = "blue")
t.test(Viscosit$first, Viscosit$second, var.equal = TRUE)
```

Visual

## Description

Data for Exercise 5.6

## Usage

Visual

## Format

A data frame/tibble with 18 observations on one variable

visual visual acuity measurement

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

#### Examples

stem(Visual\$visual)
boxplot(Visual\$visual, col = "purple")

Vocab
-------

Reading scores before and after vocabulary training for 14 employees who did not complete high school

#### Description

Data for Exercise 7.80

#### Usage

Vocab

## Format

A data frame/tibble with 14 observations on two variables

first reading test score before formal vocabulary training

second reading test score after formal vocabulary training

## Wastewat

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

#### Examples

t.test(Pair(Vocab\$first, Vocab\$second) ~ 1)

Wastewat	Volume of injected waste water from Rocky Mountain Arsenal and
	number of earthquakes near Denver

#### Description

Data for Exercise 9.18

#### Usage

Wastewat

#### Format

A data frame/tibble with 44 observations on two variables

gallons injected water (in million gallons)

number number of earthqueakes detected in Denver

## Source

            labs(x = "", y = "count")</pre>
```

## End(Not run)

Wheat

*Price of a bushel of wheat versus the national weekly earnings of production workers* 

## Description

Data for Exercise 2.11

## Usage

Wheat

# Format

A data frame/tibble with 19 observations on three variables

year year

earnings national weekly earnings (in dollars) for production workers

**price** price for a bushel of wheat (in dollars)

## Source

The World Almanac and Book of Facts, 2000.

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

#### Examples

par(mfrow = c(1, 2))
plot(earnings ~ year, data = Wheat)
plot(price ~ year, data = Wheat)
par(mfrow = c(1, 1))

Windmill

## Description

Data for Exercise 9.34

## Usage

Windmill

# Format

A data frame/tibble with 25 observations on two variables

velocity wind velocity (miles per hour)

output power generated (DC volts)

## Source

Joglekar, et al. (1989), Lack of Fit Testing when Replicates Are Not Available, *The American Statistician*, 43,(3), 135-143.

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

```
summary(lm(output ~ velocity, data = Windmill))
anova(lm(output ~ velocity, data = Windmill))
```

Window

Wind leakage for storm windows exposed to a 50 mph wind

## Description

Data for Exercise 6.54

#### Usage

Window

Wins

# Format

A data frame/tibble with nine observations on two variables

window window number

leakage percent leakage from a 50 mph wind

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

SIGN.test(Window\$leakage, md = 0.125, alternative = "greater")

W	i	n	s
	-	•••	-

Baseball team wins versus seven independent variables for National league teams in 1990

## Description

Data for Exercise 9.23

## Usage

Wins

# Format

A data frame with 12 observations on nine variables

team name of team
wins number of wins
batavg batting average
rbi runs batted in
stole bases stole
strkout number of strikeots
caught number of times caught stealing
errors number of errors
era earned run average

#### References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

Wool

## Examples

```
plot(wins ~ era, data = Wins)
## Not run:
library(ggplot2)
ggplot2::ggplot(data = Wins, aes(x = era, y = wins)) +
            geom_point() +
            geom_smooth(method = "lm", se = FALSE) +
            theme_bw()
```

## End(Not run)

Wool

## Strength tests of two types of wool fabric

#### Description

Data for Exercise 7.42

## Usage

Wool

## Format

A data frame/tibble with 20 observations on two variables

type type of wool (Type I, Type 2)

**strength** strength of wool

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

```
boxplot(strength ~ type, data = Wool, col = c("blue", "purple"))
t.test(strength ~ type, data = Wool, var.equal = TRUE)
```

Yearsunspot

## Description

Data for Exercise 2.7

## Usage

Yearsunspot

## Format

A data frame/tibble with 252 observations on two variables

number average number of sunspots

year date

## Source

NASA/Marshall Space Flight Center, Huntsville, AL 35812.

## References

Kitchens, L. J. (2003) *Basic Statistics and Data Analysis*. Pacific Grove, CA: Brooks/Cole, a division of Thomson Learning.

## Examples

plot(number ~ year, data = Yearsunspot)

z.test

Z-test

## Description

This function is based on the standard normal distribution and creates confidence intervals and tests hypotheses for both one and two sample problems.

# Usage

```
z.test(
    x,
    y = NULL,
    alternative = "two.sided",
    mu = 0,
    sigma.x = NULL,
    sigma.y = NULL,
    conf.level = 0.95
)
```

# Arguments

x	numeric vector; NAs and Infs are allowed but will be removed.
У	numeric vector; NAs and Infs are allowed but will be removed.
alternative	character string, one of "greater", "less" or "two.sided", or the initial let- ter of each, indicating the specification of the alternative hypothesis. For one- sample tests, alternative refers to the true mean of the parent population in relation to the hypothesized value mu. For the standard two-sample tests, alternative refers to the difference between the true population mean for x and that for y, in relation to mu.
mu	a single number representing the value of the mean or difference in means spec- ified by the null hypothesis
sigma.x	a single number representing the population standard deviation for x
sigma.y	a single number representing the population standard deviation for y
conf.level	confidence level for the returned confidence interval, restricted to lie between zero and one

# Details

If y is NULL, a one-sample z-test is carried out with x. If y is not NULL, a standard two-sample z-test is performed.

## Value

A list of class htest, containing the following components:

statistic	the z-statistic, with names attribute "z"
p.value	the p-value for the test
conf.int	is a confidence interval (vector of length 2) for the true mean or difference in means. The confidence level is recorded in the attribute conf.level. When alternative is not "two.sided", the confidence interval will be half-infinite, to reflect the interpretation of a confidence interval as the set of all values k for which one would not reject the null hypothesis that the true mean or difference in means is k. Here infinity will be represented by Inf.

estimate	vector of length 1 or 2, giving the sample mean(s) or mean of differences; these estimate the corresponding population parameters. Component estimate has a names attribute describing its elements.
null.value	is the value of the mean or difference in means specified by the null hypothe- sis. This equals the input argument mu. Component null.value has a names attribute describing its elements.
alternative	records the value of the input argument alternative: "greater", "less" or "two.sided".
data.name	a character string (vector of length 1) containing the actual names of the input vectors x and y

## **Null Hypothesis**

For the one-sample z-test, the null hypothesis is that the mean of the population from which x is drawn is mu. For the standard two-sample z-tests, the null hypothesis is that the population mean for x less that for y is mu.

The alternative hypothesis in each case indicates the direction of divergence of the population mean for x (or difference of means for x and y) from mu (i.e., "greater", "less", "two.sided").

```
zsum.test
```

Summarized z-test

#### Description

This function is based on the standard normal distribution and creates confidence intervals and tests hypotheses for both one and two sample problems based on summarized information the user passes to the function. Output is identical to that produced with z.test.

#### Usage

```
zsum.test(
  mean.x,
  sigma.x = NULL,
  n.x = NULL,
  mean.y = NULL,
  sigma.y = NULL,
  n.y = NULL,
  alternative = "two.sided",
  mu = 0,
  conf.level = 0.95
)
```

## Arguments

mean.x	a single number representing the sample mean of x
sigma.x	a single number representing the population standard deviation for $\boldsymbol{x}$
n.x	a single number representing the sample size for x
mean.y	a single number representing the sample mean of y

## zsum.test

sigma.y	a single number representing the population standard deviation for y
n.y	a single number representing the sample size for y
alternative	is a character string, one of "greater", "less" or "two.sided", or the ini- tial letter of each, indicating the specification of the alternative hypothesis. For one-sample tests, alternative refers to the true mean of the parent popula- tion in relation to the hypothesized value mu. For the standard two-sample tests, alternative refers to the difference between the true population mean for x and that for y, in relation to mu.
mu	a single number representing the value of the mean or difference in means spec- ified by the null hypothesis
conf.level	confidence level for the returned confidence interval, restricted to lie between zero and one

## Details

If y is NULL, a one-sample z-test is carried out with x. If y is not NULL, a standard two-sample z-test is performed.

#### Value

A list of class htest, containing the following components:

statistic	the z-statistic, with names attribute z.
p.value	the p-value for the test
conf.int	is a confidence interval (vector of length 2) for the true mean or difference in means. The confidence level is recorded in the attribute conf.level. When alternative is not "two.sided", the confidence interval will be half-infinite, to reflect the interpretation of a confidence interval as the set of all values k for which one would not reject the null hypothesis that the true mean or difference in means is k. Here, infinity will be represented by Inf.
estimate	vector of length 1 or 2, giving the sample mean(s) or mean of differences; these estimate the corresponding population parameters. Component estimate has a names attribute describing its elements.
null.value	the value of the mean or difference in means specified by the null hypothesis. This equals the input argument mu. Component null.value has a names at- tribute describing its elements.
alternative	records the value of the input argument alternative: "greater", "less" or "two.sided".
data.name	a character string (vector of length 1) containing the names x and y for the two summarized samples

## Null Hypothesis

For the one-sample z-test, the null hypothesis is that the mean of the population from which x is drawn is mu. For the standard two-sample z-tests, the null hypothesis is that the population mean for x less that for y is mu.

The alternative hypothesis in each case indicates the direction of divergence of the population mean for x (or difference of means of x and y) from mu (i.e., "greater", "less", "two.sided").
