Maintainer Kevin Shook <kevin.shook@usask.ca>

Description A collection of user-submitted functions to aid in the analysis of hydrological data, particularly for users in Canada. The functions focus on the use of Canadian data sets, and are suited to Canadian hydrology, such as the important cold region hydrological processes and will work with Canadian hydrological models. The functions are grouped into several themes, currently including Statistical hydrology, Basic data manipulations, Visualization, and Spatial hydrology. Functions developed by the Floodnet project are also included. CSHShydRology has been developed with the assistance of the Canadian Society for Hydrological Sciences (CSHS) which is an affiliated society of the Canadian Water Resources Association (CWRA). As of version 1.2.6, functions now fail gracefully when attempting to download data from a url which is unavailable.

CSHShydRology-package Functions for Canadian hydrological analyses

Description

CSHShydRology is intended for the use of hydrologists, particularly those in Canada. It will contain functions which focus on the use of Canadian data sets, such as those from Environment Canada. The package will also contain functions which are suited to Canadian hydrology, such as the important cold-region hydrological processes. **CSHShydRology** will also contain functions which work with Canadian hydrological models, such as Raven, CRHM, Watflood, and MESH.

This package has been developed with the assistance of the Canadian Society for Hydrological Sciences (CSHS) https://cshs.cwra.org/en/ which is an affiliated society of the Canadian Water Resources Association (CWRA) https://cwra.org/.

The CSHShydRology will contain functions grouped into several themes, including:

Statistical hydrology trend detection, data screening, frequency analysis, regionalization

Basic data manipulations input/conversion/adapter functions, missing data infilling

Visualization data visualization, standardized plotting functions

Spatial hydrology basin delineation, landscape data analysis, working with GIS

Streamflow measurement analysis rating curve analysis, velocity profiles, naturalization

Network design/analysis homogeneity assessment

Ecohydrology fisheries and ecological analysis

Wrappers/unwrappers between other packages and CSHShydRology

Basic_data_manipulation_functions

Basic data manipulation functions

Description

These functions read in or convert values among formats

ch_read_ECDE_flows Reads a file of WSC daily flows from ECDataExplorer

ch_get_ECDE_metadata Reads station meta data from ECDataExplorer

ch_get_wscstation Reads station information from a data file produced by ECDE

ch_read_AHCCD_daily Reads file of daily AHCCD values

ch_read_AHCCD_monthly Reads file of monthly AHCCD values

ch_tidyhydat_ECDE Reads flows using tidyhydat and converts to ECDE format

ch_tidyhydat_ECDE_meta Reads station meta data using tidyhydat and converts to ECDE-like format

CAN01AD002

Streamflow data

Description

Daily river discharge for the station 01AD002 on St. John River at Fort Kent, New Brunswick. Data ranges from 1926 to 2014, for basin area of 14700 sq km.

Usage

CAN01AD002

Format

An object of class data. frame with 32234 rows and 2 columns.

Author(s)

Martin Durocher

Source

https://wateroffice.ec.gc.ca/

6 ch_axis_doy

CAN05AA008

CAN05AA008

Description

A dataframe of Water Survey of Canada (WSC) daily flows for station 05AA008, CROWSNEST RIVER AT FRANK Alberta. Drainage area 403 km2.

Usage

CAN05AA008

Format

A dateframe with 25252 rows and 5 columns spanning the period 1910-2013.

Details

Variables:

ID StationID

PARAM Parameter 1=Flow, 2=Level

Date R date

Flow Daily flow in m³/s

SYM Water Survey FLags A, B, D, E

Source

Water Survey of Canada

ch_axis_doy

Generates the x axis beginning on specified day of year

Description

Generates an axis for day of year or day of water year; used by ch_regime_plot. Obtaining the day of water year needs to be done separately.

Usage

```
ch_axis_doy(wyear = 1)
```

Arguments

wyear

Month of beginning of water year, wyear = 1 (the default) for calendar year, wyear = 10 to start October 1.

Value

Plots a water year axis on a standard R plot

Author(s)

Paul Whitfield

See Also

```
ch_regime_plot
```

Examples

```
a <- seq(1, 365)
b <- runif(365)
plot(a, b, type = "p", xlab = "", xaxt = "n")
ch_axis_doy(wyear = 10) # starts in October</pre>
```

ch_binned_MannWhitney Compares two time periods of data using Mann-Whitney test

Description

Compares two time periods of data using the Mann-Whitney test. Data are binned based upon a bin size, and data are extracted for two time periods and tests for change between two such periods result can be passed to ch_polar_plot or ch_decades_plot for visualization.

Usage

```
ch_binned_MannWhitney(
   DF,
   step,
   range1,
   range2,
   ptest = 0.05,
   variable = "discharge",
   metadata = NULL
)
```

Arguments

DF	A data frame of hydrometric data from ch_read_ECDE_flows	
step	An integer indicating the degree of smoothing eg. 1, 5, 11.	
range1	The first and last year of first period, as c(first, last)	
range2	The first and last year of second period, as c(first,last)	
ptest	The significance level default is 0.05.	
variable	Name of variable. Default is 'discharge'	
metadata	dataframe of station metadata, default is HYDAT_list	

Value

Returns a list containing:

StationID ID of station
Station_lname Name of station
bin_width Smoothing time step
range1 First range of years
range2 Second range of years

p_used p_value

fail TRUE if test failed due to missing values

bin_method method used for binning
test_method Mann-Whitney U-statistic
series a data frame containing:
period period numbers i.e. 1:365/step

period1 median values for each bin in period 1 period2 median values for each bin in period 2

mwu Mann-Whitney U-statistic for each bin between the two periods

prob probability of U-statistic for each period

code significance codes for each bin

ch_booth_plot

ch_booth_plot Create Booth plot of peaks over a threshold	ch_booth_plot	Create Booth plot of peaks over a threshold	
---	---------------	---	--

Description

A Booth plot is a plot of peaks over threshold flood events with duration on the horizontal and either magnitude (default) or volume on the vertical axis.

Usage

```
ch_booth_plot(events, threshold, title, type = "mag", colour1 = 1, colour2 = 1)
```

Arguments

events	A data frame of POT events from the function ch_get_peaks	
threshold	The threshold used by ch_get_peaks	
title	Plot title	
type	The plot type, either 'mag' (magnitude, the default) or 'vol' (volume)	
colour1	A vector of length 12 with line colours of rings or symbols. Defaults to those used by Booth.	
colour2	A vector of length 12 with fill colours of rings or symbols. Defaults to those used by Booth.	

Value

No value is returned; a standard R graphic is created.

```
ch_get_peaks
```

ch_catchment_hyps

Examples

```
threshold <- 0.1 * max(CAN05AA008$Flow) # arbitrary threshold
peaks <- ch_get_peaks(CAN05AA008, threshold)
events <- peaks$POTevents
ch_booth_plot(events, threshold, title = "05AA008", type='mag')
ch_booth_plot(events, threshold, title = "05AA008", type='vol')</pre>
```

ch_catchment_hyps

Catchment hypsometry

Description

Finds the hypsometric curve, which is the total fraction of the area below vs. elevation, for a given basin.

Usage

```
ch_catchment_hyps(
  catchment,
  dem,
  z_{levels} = NULL,
  n_{\text{levels}} = 10,
  zmin = NULL,
  zmax = NULL,
  quantiles = NULL,
  hypso_plot = FALSE,
  z_{units} = "m",
  col = "red",
  type = "o",
  xlab = "Fraction of catchment below given elevation",
 ylab = paste0("Elevation (", z_units, ")"),
  add_grid = FALSE,
)
```

Arguments

catchment	A sf object containing the catchment divide.
dem	A raster object of the Digital Elevation Model.
z_levels	Vector of elevation levels for the hypsometry. If specified, then no other elevation parameters are required. Default is NULL.
n_levels	If specified, sets number of elevation intervals. Can be used with ${\tt zmin}$ and ${\tt zmax}$. Default is NULL.
zmin	Minimum elevation for hypsometry. If not specified, minimum catchment elevation is used. Default is NULL.

ch_catchment_hyps 11

zmax	Maximum elevation for hypsometry. If not specified, maximum catchment elevation is used. Default is NULL.
quantiles	Vector of elevation quantiles. Default is NULL.
hypso_plot	if TRUE the hypsometric curve is plotted. Default is NULL.
z_units	Elevation units for plot. Default is 'm'.
col	Colour for plot. Default is 'red'.
type	Type of plot. Defailt is 'o' (lines with overplotted points).
xlab	Plot x-axis label.
ylab	Plot y-axis label.
add_grid	If TRUE, a grid is added to the plot. Default is FALSE
	Other parameters for the graph

Details

The elevations may be passed as a vector of elevations, or of elevation quantiles, or as minimum and maximum elevations and the number of elevation intervals. A plot of the curve may also be created.

Value

Returns a data frame of elevations and catchment fractions below.

```

ch_checkcatchment

Check Catchments

Description

Generates a simple map to allow a visual assessment of the catchment boundaries relative to the elevation contours.

Usage

```
ch_checkcatchment(
  dem,
  catchment,
  outlet,
  outlet_label = NULL,
  main_label = "",
  bbox_type = "catchment",
  channel_vec = NULL,
```

ch_checkcatchment 13

```
cb_colour = "red",
pp_colour = "red",
channel_colour = "blue",
contour_colour = "grey",
plot_na = TRUE,
plot_scale = TRUE,
na_location = "tr",
scale_location = "bl"
```

Arguments

dem raster DEM that catchments were generated from.

catchment Catchment polygon (sf object).

outlet Location of catchment outlet (sf object).

outlet_label Character label for outlet.
main_label Main label for catchment plot.

bbox_type type of bounding box. If 'catchment', then the contours are bounded by the

catchment, otherwise they are plotted to the extent of the DEM

channel_vec Vectors of the channels will be plotted if specified.

cb_colour Colour for catchment outline. Default is "red".

pp_colour Colour for catchment pour points. Default is "red".

channel_colour Colour for channel. Default is "blue". contour_colour Colour for contours Default is "grey".

plot_na If TRUE (the default) a north arrow is added to the plot.
plot_scale If TRUE (the default) a scale bar is added to the plot.

na_location Location for the north arrow. Default is 'tr', i.e. top-right. scale_location Location for the scale bar. Default is 'bl', i.e. bottom-left.

Details

Also generates a table summarizing the catchments, including the coordinates of the outlet point and the catchment area.

Value

TRUE. A map of the catchments is also plotted and the catchment parameters are printed.

```

ch_checkchannels

Check Channels

Description

Generates a map of the generated channel network layer.

ch_checkchannels 15

Usage

```
ch_checkchannels(
  dem,
  channels,
  outlet = NULL,
  main_label = "",
  channel_colour = "blue",
  pp_colour = "red",
  contour_colour = "grey"
)
```

Arguments

raster DEM that catchments were generated from
channels channel polyline (or channels list from ch_wbt_channels) (sf object)
outlet location of catchment outlet (sf object)

main_label Main label for channel plot.
channel_colour Colour for channel. Default is "blue".

pp_colour Colour for catchment pour points. Default is "red".

contour_colour Colour for contours Default is "grey".

Details

Generates a simple map of the drainage network plotted over the contours to allow a visual assessment.

Value

check_map a **ggplot** object of a map with channel layer

ch_circ_mean_reg

Calculates the circular mean, median, and regularity

Description

Calculate the circular mean, median, and regularity using a year of 365 days. Days of year are converted to degrees internally, results are returned as positive days of year

Usage

```
ch_circ_mean_reg(dataframe)
```

Arguments

dataframe

a dataframe of day year of event; can be amax or pot.

Value

Returns a list of the following statistics

n number of samples

ch_clear_wd

mean circular mean of array
median circular median of array

rho regularity or mean resultant length

```

ch_clear_wd

Clear Working Directory

Description

Empties and removes a working directory.

Usage

```
ch_clear_wd(wd, do_check = TRUE)
```

Arguments

wd working directory file path

directory. If TRUE, the directory is deleted without confirmation.

Details

The data for raster layers read in as Whitebox files are held on disk rather than in memory

Value

result returns TRUE upon successful execution

ch_color_gradient

Author(s)

Dan Moore

See Also

ch_create_wd to create working directory

Examples

```
# not tested as deleting all files in the directory cannot be tested in CRAN
# create an empty working directory
my_wd <- tempdir()
ch_create_wd(my_wd) # confirm creation
# clear the working directory
ch_clear_wd(my_wd)</pre>
```

ch_color_gradient

ch_color_gradient

Description

set colour gradient

Usage

```
ch_color_gradient(
    x,
    colors = c("darkred", "red", "white", "green", "darkgreen"),
    colsteps = 100,
    climits = NULL
)
```

Arguments

x array of variable

colors an array of colours to form the desired gradient. Default is ("darkred", "red",

"white", "green", "darkgreen")

colsteps number of steps to be used in gradient, default is 100.

climits provide specific limits for common scaling

Value

vector of colors

ch_col_gradient 19

Author(s)

Paul Whitfield

Examples

```
cxin <- c(0, 1, 1, 3, 4, 5, 10)
cxout <- ch_color_gradient(cxin)
#[1] "#8B0000" "#B50000" "#B50000" "#FF2B2B" "#FF9292"
#[6] "#FFF9F9" "#006400"</pre>
```

ch_col_gradient

Creates a colour gradient

Description

Creates a colour gradient for plotting.

Usage

```
ch_col_gradient(
    x,
    colors = c("darkred", "red", "white", "blue", "darkblue"),
    colsteps = 100,
    climits = NULL
)
```

Arguments

Vector of values used for gradient.
 Vector of colours to form a gradient. Default is `c("darkred", "red", "white", "blue", "darkblue") `.
 The number of steps in the gradient. Default is 100.

climits Sets specific limits for common scaling.

Value

res returned array of colour codes

Author(s)

modified by Paul Whitfield

20 ch_col_transparent

Examples

```
plot(rnorm(20),col='black')

# create a red blue colour gradient for plotting
mycol <- ch_col_gradient(rnorm(20), colsteps = 100)

# plot more random points in transparent blue colour
points(rnorm(20), col = mycol)</pre>
```

ch_col_transparent

Add Transparency to plot colours

Description

Adds transparency to a colour based on an integer between 0 and 255, with 0 being fully transparent and 255 being opaque. Based on function rvn_col_transparent in package **RavenR**.

Usage

```
ch_col_transparent(colour, trans)
```

Arguments

colour colour that is to be made transparent, or an array of colours

trans an integer (or array of integers) describing the degree of transparency, 0 to 255.

Must be the same length as colour. Values < 10 (very transparent), values > 200

(solid colour).

Value

res returned updated colour code with transparency

Author(s)

Rob Chlumsky; Paul Whitfield

See Also

See original code on post in Stack Overflow plot points transparent in R

```
# plot randomly distributed data
plot(rnorm(20), col='black')

# create a transparent blue colour for plotting
mycol <- ch_col_transparent('blue', 100)</pre>
```

ch_contours 21

```
# plot more random points in transparent blue colour
points(rnorm(20),col = mycol)

# plot randomly distributed data
plot(rnorm(20), col = 'blue')

# create two transparent colour for plotting
mycol <- ch_col_transparent(c('green',"red"), c(100, 200))

# plot more random points in transparent colours
points(rnorm(20), col = mycol[2])</pre>
```

ch_contours

Create Contours

Description

Creates contour lines from a DEM.

Usage

```
ch_contours(dem, zmin = NULL, zmax = NULL, n_levels = 10, z_levels = NULL)
```

Arguments

dem	Raster object of your dem in the desired projection (note: should have had sinks removed).	
zmin	Minimum elevation value for contours. If not specified, minimum value 'dem' is used.	
zmax	Maximum elevation value for contours. If not specified, maximum value 'dem is used.	
n_levels	Number of contour lines. Default is 10.	
z_levels	Levels at which to plot contours. If specified, overrides 'zmin', 'zmax' and 'n_levels'.	

Details

Generates contour lines from a DEM, which are returned as an **sf** object. The user can either provide a vector of elevation values by specifying the z_{levels} argument, or by supplying the minimum and maximum elevations (z_{min} and z_{max}) and the number of contour lines (n_{levels}).

Value

```
contours_sf sf object containing contours
```

ch_create_wd

Author(s)

Dan Moore

Examples

```
# use volcano DEM
dem <- ch_volcano_raster()
# generate contours
contours <- ch_contours(dem)
# plot contours map
plot(contours)</pre>
```

ch_create_wd

Create working directory

Description

Creates a working directory.

Usage

```
ch_create_wd(wd)
```

Arguments

wd

name of a directory in which to store files created by WhiteboxTools functions

Value

TRUE

returns TRUE upon successful execution

Author(s)

Dan Moore

See Also

```
ch_clear_wd to clear the working directory
```

```
# not tested automatically as will return a warning
ch_create_wd(tempdir())
```

ch_cut_block 23

ch_cut_block	
--------------	--

Description

The function could also be used to get the same period of time from several station for comparison.

Usage

```
ch_cut_block(DF, st_date, end_date)
```

Arguments

DF A daily streamflow data frame as from ch_read_ECDE_flows

st_date starting date format is %Y/%m/%d end_date ending date format is %Y/%m/%d

Value

Returns a portion of the original dataframe.

Author(s)

Paul Whitfield

Examples

```
data(CAN05AA008)
subset <- ch_cut_block(CAN05AA008,"2000/01/01", "2010/12/31")</pre>
```

ch_date_subset Subsets dates by string

Description

Subsets a data frame by an specified date range, provided as a string by the prd argument. This function is meant to emulate the subsetting capability of the **xts** package.

Usage

```
ch_date_subset(df, prd)
```

Arguments

df	data frame of time series data; includes a variable called Date
prd	date range as string formatted as 'YYYY-MM-DD/YYYY-MM-DD'

24 ch_decades_plot

Value

df

subsetted data frame

Author(s)

Robert Chlumsky

Examples

```
{
dd <- seq.Date(as.Date("2010-10-01"), as.Date("2013-09-30"), by = 1)
x <- rnorm(length(dd))
y <- abs(rnorm(length(dd)))*2
df <- data.frame("Date" = dd,x,y)
prd <- "2011-10-01/2012-09-30"
summary(ch_date_subset(df,prd))}</pre>
```

ch_decades_plot

Plots output from ch_binned_MannWhitney for decades

Description

Creates a simple plot comparing two decades from the output of ch_binned_MannWhitney.

Usage

```
ch_decades_plot(mplot)
```

Arguments

mplot

List output by the function ch_binned_MannWhitney

Value

A standard R graphic is created.

Author(s)

Paul Whitfield

See Also

```
ch_decades_plot
```

ch_doys 25

Examples

```
range1 <- c(1970, 1979)
range2 <- c(1990, 1999)
b_MW <- ch_binned_MannWhitney(CAN05AA008, step = 5, range1, range2, ptest = 0.05)
<math>ch_decades_plot(b_MW)
```

ch_doys

Days of year and water year

Description

Converts an array of dates into a dataframe with date, year, month, doy, wyear, dowy.

The day of water year is computed from the first of the specified water year month.

Usage

```
ch_doys(Date, water_yr = 10)
```

Arguments

Date an array of R dates, as produced by as.Date()

water_yr the month starting the water year, default is 10 (October). If a value of 1 is

specified, the 10 will be used.

Details

Converts a date array into a data frame with years, wateryears, and days of year and of water year.

Value

Returns a dataframe with date information:

Date in Date format

year numeric calendar year month number calendar month doy numeric day of year

wyear numeric water year starting on day 1 of selected month

dwy numeric day of water year

Author(s)

Paul Whitfield, Kevin Shook

```
dd <- seq.Date(as.Date("2010-01-01"), as.Date("2018-01-01"),by = 1)
output <- ch_doys(dd, water_yr=10)
head(output)</pre>
```

26 ch_fdcurve

ch_fdcurve	Plot Flow Duration Curve	

Description

A flow duration curve is a plot of flow magnitude against exceedance probability. The plot may contain the Gustard Curves (default) or they can be omitted. The default is for curves to be plotted against probability, but an option is to plot against the normalized exceedance probability. In that case, the x axis represents a normal distribution.

Usage

```
ch_fdcurve(DF, normal = FALSE, gust = TRUE, metadata = NULL)
```

Arguments

DF a dataframe of daily flows from ch_read_ECDE_flows

normal If normal = TRUE then exceedance probability is normalized. Default is FALSE.

gust If TRUE (the default), adds the curves from Gustard et al. 1992 are added.

metadata dataframe of metadata, defaults to HYDAT_list.

Details

Create a Flow Duration Curve based upon Observations.

Value

Plots the flow duration curve and returns a data frame containing:

exceedance probability

probability

flow d=flow values

Author(s)

Paul Whitfield

References

ch_flow_raster 27

Examples

```
data(HYDAT_list)
data(CAN05AA008)
# plot with Gustard 1992 curves
test <- ch_fdcurve(CAN05AA008, normal = FALSE, gust = TRUE)
# plot with normalized exceedance probability
test <- ch_fdcurve(CAN05AA008, normal = TRUE, gust = FALSE)</pre>
```

ch_flow_raster

Raster plot of daily streamflows

Description

Produces a raster plot: years by day of year, showing magnitude of flow. This produces a plot showing the flow data in colours, showing different context than in a hydrograph. High flows are in warm colours.

Usage

```
ch_flow_raster(
   DF,
   rastercolours = c("lightblue", "cyan", "blue", "slateblue", "orange", "red"),
   metadata = NULL
)
```

Arguments

DF A data frame of daily flow data as read by ch_read_ECDE_flows.

rastercolours A vector of colours used for flow magnitudes (default c("lightblue", "cyan",

"blue", "slateblue", "orange", "red")).

metadata A dataframe of station metadata, defaults to HYDAT_list.

Value

No value is returned; a standard R graphic is created.

Author(s)

Paul Whitfield

See Also

```
ch_read_ECDE_flows

```

28 ch_flow_raster_qa

Examples

```
ch_flow_raster(CAN05AA008)
```

ch_flow_raster_qa

Raster plot of daily streamflows with WSC quality flags

Description

Raster plot with WSC quality flags. This produces a plot showing the flow data in grayscale overlain by the Water Survey of Canada quality flags. Colours are consistent with ECDataExplorer. Raster layout lets the use see the flags in a different context than in a hydrograph.

Usage

```
ch_flow_raster_qa(DF, metadata = NULL)
```

Arguments

DF dataframe of daily streamflow read by ch_read_ECDE_flows

metadata dataframe of metadata or defaults to "HYDAT_list"

Value

Produces a raster plot: years against day of year, showing the data flags:

A (Partial) in green

B (Backwater) in cyan

D (Dry) in yellow

E (Estimated) in red

Returns TRUE if executed properly; a standard R graphic is created.

Author(s)

Paul Whitfield

```
data(HYDAT_list)
data(CAN05AA008)
qaplot <- ch_flow_raster_qa(CAN05AA008)</pre>
```

29 ch_flow_raster_trend

ch_flow_raster_trend Raster plot and simple trends of observed streamflows by periods

Description

Creates a raster plot plus trend plots for day of year, which are binned by a number of days (step), and the max, min, and median annual discharge across years. The plot contains four panels based upon binned data.

Usage

```
ch_flow_raster_trend(
  DF,
  step = 5,
  missing = FALSE,
  metadata = NULL,
  colours = c("lightblue", "cyan", "blue", "slateblue", "darkblue", "red")
```

Arguments

DF - dataframe of daily flow data as read by ch_read_ECDE_flows step - a number indicating the degree of smoothing eg. 1, 5, 11. If FALSE years with missing data are excluded. If TRUE partial years are included. missing a dataframe of station metadata, default is HYDAT_list. metadata

colours A vector of colours used for the raster plot. The default is c("lightblue", "cyan",

"blue", "slateblue", "darkblue", "red").

Details

The four plots are: (1) The maximum, minimum, and median flow with a trend test for each period: red arrows indicate decreases, blue arrows indicate increases. (2) The scale bar for the colours used in the raster plot, (3) The raster plot with a colour for each period and each year where data exist, and (4) A time series plot of the minimum, median, and maximum annual bin values. If there is no trend (p > 0.05) the points are black. Decreasing trends are in red, increasing trends are in blue.

Value

Returns a list containing:

Station ID eg. 05BB001 stationID missing How missing values were used FALSE = used, TRUE = removed number of days in a bin step number of periods in a year periods period period numbers i.e. 1:365/step

30 ch_flow_raster_trend

bins values for each period in each year

med_period median for each period

max_period maximum for each period

min_period minimum for each period

tau_period Kendalls Tau for each period

prob_period probability of Tau for each period

year years spanning the data

median_year median bin for each year

max_year maximum bin for each year

min_year minimum bin for each year

tau_median_year

value of tau and probability for annual median

tau_maximum_year

value of tau and probability for annual maximum

tau_minimum_year

value of tau and probability for annual minimum

```
ch_flow_raster
```

```
data(CAN05AA008)
mplot <- ch_flow_raster_trend(CAN05AA008, step=5)</pre>
```

Description

Reads the file that is generated from ECDE 'save favourite stations' to capture the ECDE metadata. The dataframe returned contains 20 fields from ECDE.

Usage

```
ch_get_ECDE_metadata(filename, writefile = NULL)
```

Arguments

filename The name of the ECDE file, 'FavHydatStations.tb0'.

writefile Default is NULL, but if it is a filename e.g. 'filename.csv' then the dataframe

is saved to a csv file.

Value

Returns a dataframe consisting of:

Station StationID
StationName Station Name

HYDStatus Active or Discontinued

Prov Province

Latitude Longitude

DrainageArea km²

Years Number of years with data

From Start Year
To End Year
Reg. Regulated?

Flow If TRUE/Yes flow data exists
Level If TRUE/Yes level data exists
Sed If TRUE/Yes sediment data exists

OperSched Operations current - Continuous or Seasonal
RealTime If TRUE/Yes real time data is available

RHBN If TRUE/Yes the stations is in the reference hydrologic basin network

Region Name of regional office operating station

Datum Elevation datum

Operator Operator or provider of the data

32 ch_get_peaks

Author(s)

Paul Whitfield <paul.h.whitfield@gmail.com>

Examples

```
## Not run:
# Don't run this example as it requires an ECDE file
filename <- "FavHydatStations.tb0"</pre>
                                             # dummy file name (not supplied)
meta0 <- ch_get_ECDE_metadata(filename)</pre>
meta1 <- ch_get_ECDE_metadata(filename, writefile="study52_metadata.csv")</pre>
## End(Not run)
```

ch_get_peaks

Extracts peak flows over a threshold

Description

This function is development code being shared as is. It is expected that the user will be interested in the data frame returned for POT analysis and for plotting (i.e. ch_booth_plot).

This function retrieves peaks greater than or equal to the prescribed threshold. It returns a data frame of peak characteristics suitable for subsequent analysis.

The portion under development is returns a list of the flows during an event with the values of the four preceding days and three subsequent days. If the peak is a single point the fragment is nine points long; if the events is longer the fragment contains all days above the threshold and eight additional days.

Usage

```
ch_get_peaks(dataframe, threshold)
```

Arguments

dataframe a data frame of streamflow data containing columns named 'Date' and 'Flow' threshold a value for the threshold. Values above the threshold are tested for peaks.

Value

Returns a list containing:

POTevents a dataframe contining details of the events events a vector with the value 0 when the flow is below the threshold and 1 when above. a vector with the value 0 when the flow is below a threshold or the index of the event_num events when the threshold was exceeded. i.e. 1,2,3, etc start date of events

st_date

a list of the daily flows in each individual event (see details for more information) case

ch_get_url_data 33

The POTevents data frame contains five columns:

st_date starting date of event

max_date date of maximum in the event
max maximum discharge during event
volume flow volume during the event
duration length of the event in days

The case list contains the flows during an event and also for four preceding and subsequent days. Each event will have a length between nine to n days in length. Note: in rare cases where the event is in progress when data becomes available the event might be shorter than nine days long.

```

ch_get_url_data

Gets remote data sets

Description

Accesses data sets, via a url the first time, saves them locally, then accesses them locally after the first time the script is executed.

Usage

```
ch_get_url_data(gd_url, gd_filename, quiet = FALSE)
```

34 ch_get_url_data

Arguments

gd_url url for accessing data set

gd_filename name of file on local drive, including full path

quiet Optional. If FALSE (the default) error/warning messages are printed if the data

cannot be found.

Value

Returns a data frame (from a .csv file), a raster object (from a .tif file), or an sf object (from a GeoJSON file).

Author(s)

Dan Moore

ch_get_wscstation

Reads station information from a data file produced by ECDE

Description

Retrieves station information for an individual Water Survey of Canada site, based on stationID; adds a text string at position 21 that combines key elements for a title.

Usage

```
ch_get_wscstation(stnID, metadata = NULL)
```

Arguments

stnID A Water Survey of Canada station number

metadata a data frame of station information from ECDataExplorer. The data frame

'HYDAT_list' is supplied with this package.

Value

Returns a line from a data frame with 21 variables

Station StationID
StationName Station Name

HYDStatus Active or Discontinued

title <- s_info[21]
print(title)</pre>
```

ch_hydrograph_plot

Hydrograph plot

Description

Creates a hydrograph plot for simulated, observed, and inflow hydrograph series, including precipitation if provided. The secondary y axis will be used to plot the precip time series.

Usage

```
ch_hydrograph_plot(
  flows = NULL,
  precip = NULL,
  prd = NULL,
  winter_shading = FALSE,
  winter_colour = "cyan",
  range_mult_flow = NULL,
  range_mult_precip = 1.5,
  flow_labels = NULL,
  ylabel = NULL,
  precip_label = "Precipitation [mm]",
  leg_pos = NULL,
  leg_box = NULL,
  zero_axis = TRUE
)
```

ch_hydrograph_plot 37

Arguments

flows data frame of flows to plot

precip data frame of precipitation values to plot

prd period to use in plotting

winter_shading optionally adds a transparent cyan shading for the December 1st to March 31st

period in each year that is plotted. Default is FALSE.

winter_colour colour to use in winter shading polygons

range_mult_flow

range multiplier for max value in hydrograph. This is useful in preventing overlap if precip is also plotted. This value should not be less than 1.0, otherwise the

values will be cutoff in the plot.

range_mult_precip

range multiplier for max value in precipitation plot (default 1.5)

flow_labels string vector of labels for flow values

ylabel text label for y-axis of the plot (default 'Flow [m^3/s]')

precip_label text label for precipitation y-axis (default 'Precipitation [mm]')

leg_pos string specifying legend placement on plot e.g. 'topleft', 'right', etc., and is

consistent with the legend function options. If NULL, the function will place the

legend left, if precip added, on the topleft otherwise).

leg_box boolean on whether to put legend in an opaque white box or not. If NULL (the

default), the function will automatically not use a white box and leave the back-

ground of the legend transparent.

zero_axis fixes the y axis to start exactly at zero (default TRUE). By default, R will plot the

values with a small buffer for presentation. Be warned that if this option is set to TRUE, the minimum value is set to zero without checking if any flow values are less than zero. This option should not be used for reservoir stage plotting,

since most reservoir stage is typically reported as an elevation.

Details

Assumes that the supplied time series have the same length and duration in time. If this is not true, then the defined period or period calculated from the first available flow series will be used to determine the plotting limits in time. The supplied time series should be in **xts** format. Note that a plot title is purposely omitted in order to allow the automatic generation of plot titles.

Value

Returns TRUE if the function is executed properly.

Author(s)

Robert Chlumsky

38 ch_polar_plot

Examples

```
# example with synthetic random data
dd <- seq.Date(as.Date("2010-10-01"), as.Date("2013-09-30"),by = 1)
x <- abs(rnorm(length(dd)))
y <- abs(rnorm(length(dd))) * x
df <- data.frame("Date" = dd, x, y)
myprd <- "2011-10-01/2012-09-30"

precip <- data.frame("Date" = dd," precip" = abs(rnorm(length(dd))) * 10)

# basic hydrograph plot
ch_hydrograph_plot(flows = df, winter_shading = FALSE)

# with different labels and winter shading
ch_hydrograph_plot(flows = df, winter_shading = TRUE,
flow_labels = c("simulated", "observed"))

# add precipitation, increase the plot ranges to separate flows and precip, and add a legend box
ch_hydrograph_plot(flows = df, precip = precip, range_mult_flow = 1.7,
range_mult_precip = 2, leg_box = TRUE)</pre>
```

ch_polar_plot

Polar plot of daily streamflows

Description

Produces a polar plot similar to that used in *Whitfield and Cannon*, 2000. It uses output from the function ch_binned_MannWhitney or a data structure created using the function ch_polar_plot_prep.

Usage

```
ch_polar_plot(
   bmw,
   lcol1 = c("black", "gray50"),
   lcol2 = c("black", "gray50"),
   lfill = c("yellow", "green"),
   lsig = c("red", "blue")
)
```

Arguments

bmw	output from ch_binned_MannWhitney
lcol1	line colour, default is c("black", "gray50")
lcol2	point colour, default is c("black", "gray50")
lfill	fill colour, default is c("yellow", "green")
lsig	significance symbol colour, default is c("red", "blue")

ch_polar_plot_peaks 39

Value

No value is returned; a standard R graphic is created.

out_cex = 0.8,
...
)
```

Arguments

title	a title to be added to the plot
direction	a value or array of mean/median direction, circular mean or median of points from ch_circ_mean_reg (optional)
regularity	a value or array of regularity from ch_circ_mean_reg (optional).
days	an array of days of year to be plotted on perimeter (optional).
shading	if TRUE adds shading and labels for nival and pluvial regimes default = FALSE
shade	percentage of shading, default is 35.
pt_col	colour used for points for events. default = "darkblue". If pt_col is an array it is used to colour the individual points of days
in_pch	a value or an array of symbols to be used for centroids. To be in color, must be one of 21 to 25 to get a symbol with border, elsewise a red symbol is plotted.
in_cex	an array of symbol sizes
in_col	an array of colors, either numbers or names to apply to centroid points (optional, default is "red")
in_detail	an array of indices indicating symbol [1] shape, [2] colour, [3] background, and [4]size
labels	an array of labels to be placed beside points with direction and regularity (optional)
label_pos	an array of positions indicating when label be placed (1, 2, 3, or 4 - below, left, above, right)(optional - default is below)
out_pch	symbols for points on outside of circle
out_cex	point size for symbol
•••	other plot options

Value

Creates a circular plot of peak flows.

Note

points inside the plot

in_pch, in_col, and in_cex will normally be of the same length and that would be the maximum index of in_detail

points on the outside

ch_polar_plot_prep 41

Author(s)

Paul Whitfield

Examples

```
# base plot
ch_polar_plot_peaks()
#base plot with area shading
ch_polar_plot_peaks(shading = TRUE)
# plot of annual maximum series
data(CAN05AA008)
am <- ch_sh_get_amax(CAN05AA008)</pre>
ch_polar_plot_peaks(days = am$doy, title = "05AA008")
#remove partial years
am <-am[am$days >= 365,]
ch_polar_plot_peaks(days = am$doy, title = "05AA008")
#plot the centroid
m_r <- ch_circ_mean_reg(am)</pre>
ch_polar_plot_peaks(direction = m_r$mean, regularity = m_r$regularity, title = "05AA008")
# plot peaks and centroid
ch_polar_plot_peaks(days = am$doy, direction = m_r$mean, regularity = m_r$regularity,
title = "05AA008")
```

ch_polar_plot_prep

Creates a data structure to be passed to ch_polar_plot

Description

Could be used to move data from a different type of analysis different to the ch_binned_MannWhitney function which uses flows. The two series need to be of the same length and their length is related to the step size. For examples, for five day periods there will be 73 periods.

42 ch_polar_plot_prep

Usage

```
ch_polar_plot_prep(
  station,
  plot_title,
  step,
 χ0,
 x1,
  stat,
 prob,
  test_s,
  variable = "discharge",
 bin_method = "unstated",
  test_method = "unstated",
  lline1 = "Period 1",
  lline2 = "Period 2",
 pvalue = 0.05
)
```

Arguments

station	Typically a station number
plot_title	Polar plot title - usually a station name
step	The number of days binned
x0	Time series of length n for a single seasonal cycle
x1	Time series of length n for a single seasonal cycle
stat	Time series of length n for statistical test value for each bin
prob	Time series of length n of probability of test value
test_s	Vector with values of -1, 0, 1 for significance, -1 negative, 1 positive, 0 not significant
variable	Name of variable plotted. Default is 'discharge'
bin_method	Default is 'unstated'
test_method	Default is 'unstated'
lline1	Names of first period, default is 'Period 1'
lline2	Names of second period, default is 'Period 2'
pvalue	Value of p used. Default is 0.05

Value

Returns a list containing:

StationID ID of station
Station_lname Name of station
variable Name of variable

bin_width Smoothing time step in days

ch_qa_hydrograph 43

range1 First range of years range2 Second range of years

p_used p_value

fail TRUE if test failed due to missing values

bin_method Method used for binning

test_method Mann-Whitney U

series A data frame containing six columns

The series data frame contains

period period numbers i.e. 1:365/step

period1 median values for each bin in period 1 period2 median values for each bin in period 2

mwu Mann Whitney U-statistic for each bin between the two periods

prob probability of U for each period code significance codes for each bin

ch_binned_MannWhitney ch_polar_plot

ch_qa_hydrograph Plots a hydrograph with the data quality symbols and returns a report on qa symbols and missing data.

Description

Plots a hydrograph of a WSC daily data file read from from ECDataExplorer (ECDE). The hydrograph shows individual days with data quality symbols [SYM] in colour and counts cases of each and reports them in the legend. The colours and symbols are those produced by ECDataExplorer.

There is an option is to provide start and end dates to show only part of the time period for which data exists and the plot is annotated to indicate this. Counts of missing observations is also provided in the legend.

44 ch_qa_hydrograph

Usage

```
ch_qa_hydrograph(
   DF,
   st_date = NULL,
   end_date = NULL,
   cts = TRUE,
   rescale = FALSE,
   sym_col = c("black", "green", "cyan", "yellow", "red", "white"),
   metadata = NULL
)
```

Arguments

DF Data frame retrieved from ECDataExplorer as returned by the function ch_read_ECDE_flows.

st_date Optional start date in the form 'yyyy-mm-dd'. Default is NULL. end_date Optional end date in the form 'yyyy-mm-dd'. Default is NULL.

cts If TRUE (the default) shows the counts of SYM in the legend. If FALSE the counts

are omitted as in ECDE.

rescale If FALSE (the default), the y-axis scaling is determined by the time period. If

TRUE then determined by the whole dataset.

sym_col Colours used for SYM; default is those used in ECDE ("black", "green", "cyan", "yellow",

"red", "white"). The final "white" can be changed to highlight missing data

points.

metadata a dataframe of station metadata, default is HYDAT_list.

Value

Produces a plot and returns a list that contains:

```
station name or title used
```

st_date starting date end_date ending data

n the number of data points
sym_count summary of the SYM counts
missing number of missing data

Author(s)

```

```
ch_read_AHCCD_daily Reads AHCCD daily file
```

Description

This program reads an Adjusted and Homogenized Canadian Climate Data (AHCCD) of daily precipitation or temperatures. The values are arranged as month x day, which makes them difficult to read using standard R functions.

Usage

```
ch_read_AHCCD_daily(daily_file)
```

Arguments

daily_file Required. Name of the file to be read.

Value

If successful, returns the values in a data frame, consisting of the date, the value and the data code.

Author(s)

Kevin Shook

References

Daily AHCCD data are available from http://crd-data-donnees-rdc.ec.gc.ca/CDAS/products/EC_data/AHCCD_daily/. Any use of the data must cite Mekis, E and L.A. ## End(Not run)</pre>
```

 ${\tt ch_read_AHCCD_monthly} \ \ \textit{Reads AHCCD monthly file}$

Description

This program reads an Adjusted and Homogenized Canadian Climate Data (AHCCD) data of precipitation or temperatures. The values are arranged as year x month, which makes them difficult to read using standard R functions.

Usage

```
ch_read_AHCCD_monthly(monthly_file = NULL)
```

Arguments

monthly_file Required. Name of the file to be read.

Value

If successful, returns the values in a dataframe, consisting of the year, the month, the value and the data code.

Author(s)

Kevin Shook

References

Any use of the data must cite Mekis, E and L.A. Vincent, 2011: An overview of the second generation adjusted daily temperature and precipitation dataset for trend analysis in Canada. Atmosphere-Ocean, 49 (2), 163-177.

## End(Not run)</pre>
```

ch_read_ECDE_flows 47

ch_read_ECDE_flows

Reads a file of WSC daily flows from ECDataExplorer (ECDE)

Description

Reads in a file WSC daily flows as returned from the Windows program ECDataExplorer, converts the Date, and omits the last 3 lines as these contain the data disclaimer and not data. The function can read values from a url.

Usage

```
ch_read_ECDE_flows(filename)
```

Arguments

filename Datafile retrieved from ECDataExplorer.

Value

Returns a dataframe with the last three rows removed:

ID stationID

PARAM Parameter 1 for Flow 2 for Level

Date original charater string converted to date format

Flow Daily mean flow m³/sec

SYM Quality flag

Author(s)

Paul Whitfield

```
## Not run:
# Not run as requires a file returned by the Windows program ECDataExplorer
# Using a dummy file name as an example
mfile <- "04JD005_Daily_Flow_ts.csv"
mdata <- ch_read_ECDE_flows(mfile)
## End(Not run)

# Not tested automatically as it is slow to read from a url
url1 <- "https://zenodo.org/record/7007830/files/08NL007_Daily_Flow_ts.csv"
values <- ch_read_ECDE_flows(url1)</pre>
```

ch_regime_plot

~h	regime	~1~+
cn	regime	nint

Plots the regime of daily streamflows using quantiles

Description

Produces a regime hydrograph similar to that in the reference. It shows the flow quantiles for each day of the year and the maximum and minimum. Parameters can be set to change colours and set the y-scale to allow plots of same scale to be produced.

Usage

```
ch_regime_plot(
   DF,
   wyear = 1,
   colour = TRUE,
   mx = 1,
   metadata = NULL,
   quant = c(0.95, 0.9, 0.75, 0.5, 0.25, 0.1, 0.05)
)
```

Arguments

DF	data frame of daily flow data
wyear	set wyear = 10 for October, water year = 1 for calendar year, can be any month
colour	if TRUE plot is in colour, if FALSE plot is grayscale.
mx	set the maximum y value; if = 1 then maximum value of the flows is used to set
metadata	a data frame of metadata, defaults to HYDAT_list. the y-axis value. The value of mx can be specified to produce a series of plots with the same scale.
quant	quantiles; default is quant = $c(0.95, 0.9, 0.75, 0.5, 0.25, 0.1, 0.05)$. Can be changed but the length must be 7 and the 4th value must be 0.5 (median)

Value

No value is returned; a standard R graphic is created.

Examples

```
data(CAN05AA008)
ch_regime_plot(CAN05AA008, colour = TRUE, wyear = 1)
```

ch_rfa_distseason

Distance in seasonal space

Description

Calculates a matrix of distances between points in the seasonal space that characterizes timing and regularity. It is equivalent to Euclidean distance applied to regularity (radius) and timing (angle) separately.

Usage

```
ch_rfa_distseason(x, ...)
## S3 method for class 'numeric'
ch_rfa_distseason(x, a, w = 1/pi, ...)
## S3 method for class 'data.frame'
ch_rfa_distseason(x, w = 1/pi, ...)
## S3 method for class 'formula'
ch_rfa_distseason(form, x, w = 1/pi, ...)
```

Arguments

x, a	Coordinates in the seasonal space. Can be a data.frame or vectors with radius x and angle a.
	Other parameters.
W	Weight to favor angle over radius. By default it is $1/pi$, which bring angle in the interval $[0,1]$.
form	Formula and dataset providing the coordinates of the seasonal space. Must be of the form radius ~ angle.

Value

Returns a matrix of distances between points in the seasonal space that characterizes timing and regularity.

```

Examples

ch_rfa_extractamax

Extracts the annual maxima of a daily time series

Description

Extracts the annual maxima of a daily time series

Usage

```
ch_rfa_extractamax(x, ...)
## S3 method for class 'formula'
ch_rfa_extractamax(form, x, tol = 0, ...)
## Default S3 method:
ch_rfa_extractamax(x, tol = 0, nlab = "n", ylab = "yy", ...)
```

Arguments

X	Data. If no formula is passed, the first column must be the value and the second the date.
	Other parameters.
form	Formula of the form value ~ date that specifies the variable from which the annual maximums are extracted and a date variable.
tol	Filter the years having less than tol days.
nlab, ylab	Names for the added columns representing respectively the number of yearly observations and the year. If set to NULL the given column is not added.

ch_rfa_julianplot 51

Value

Returns a data frame containing the annual (Monthly) maxima, the date and the number of observations during the year.

Author(s)

Martin Durocher

Examples

```
out <- ch_rfa_extractamax(flow ~ date, CAN01AD002, tol = 350) head(out)
```

ch_rfa_julianplot

Circular plotting by day of year

Description

Create axis for plotting circular statistics in a unitary circle.

Usage

```
ch_rfa_julianplot(
  rose.col = "gray40",
  rose.lwd = 1.5,
  rose.cex = 1.5,
  rose.radius = seq(0.25, 1, 0.25),
  ...
)
```

Arguments

```
rose.col, rose.lwd, rose.cex
Properties of the polar axes.

rose.radius
Vector of the position of the circular axis.

Other parameter passed to points.
```

Value

Returns a empty rose plot by day of year

Author(s)

Martin Durocher

52 ch_rfa_seasonstat

See Also

```
ch_rfa_seasonstat.
```

Examples

```
data(flowAtlantic)
ss <- ch_rfa_seasonstat(date ~ id, flowAtlantic$ams)
ch_rfa_julianplot()
points(y ~ x, ss, pch = 16, col = cut(ss[,'radius'], c(0,.5,.75,1)))</pre>
```

ch_rfa_seasonstat

Seasonal statistics for flood peaks

Description

Return the circular or seasonal statistics of flood peaks. The angle represents the mean timing of the floods and the radius its regularity. For example, a radius of one represents perfect regularity. Can perform the analyses on multiple sites.

Usage

```
ch_rfa_seasonstat(x, ...)
## S3 method for class 'data.frame'
ch_rfa_seasonstat(x, ...)
## S3 method for class 'formula'
ch_rfa_seasonstat(form, x, ...)
```

Arguments

X	Data. If data.frame with two columns, they must be respectively the date and a site variable.
	Other parameters.
form	Formula that specifies the date and site variable. Must be of the form date \sim site.

Value

Returns the circular or seasonal statistics of flood peaks.

Author(s)

Martin Durocher

ch_rfa_julianplot()
points(y ~ x, st, col = 2, pch = 16)</pre>
```

ch_sh_get_amax

Extracts annual maximum values from ECDE dataframe.

Description

Extracts annual maximum values, the date of occurrence, the day of year, and the completeness from ECDE dataframe. Uses functions from timeDate (as.timeDate, dayOfYear).

Usage

```
ch_sh_get_amax(df)
```

Arguments

df

A dataframe of daily streamflow data from ECDE

Value

Returns a dataframe with the following variables

```
year
```

annual maximum

54 ch_slice

```
date of annual maximum
```

day of year of annual maximum

days

number of days with observations

Author(s)

Paul Whitfield

See Also

```

Examples

```
data(CAN05AA008)
amax <- ch_sh_get_amax(CAN05AA008)
str(amax)</pre>
```

ch_slice

Converts doy or dwy into a factor that is used to bin data

Description

Converts a series of a variable such as day of year into numbered bins. Whenever the number of bins does not divide in 365 evenly a message showing the number of bins created and the number of days added to the last bin is provided.

Simply put, ch_slice is used to convert doy into a factor which is a number of bins per year. A year can be converted into any number of bins; slice does it based upon a number of days. So when you send it an array of doy it slices that into bins of the desired width. For example, if the step is 5. They 365/5 gives 73 bins and because of leap years there might be one extra day added every four years to the final bin.

To illustrate for a bin of 5 days: doy: 1 2 3 4 5 6 7 8 9 10 11 12 Bin: 1 1 1 1 1 2 2 2 2 2 3 3

Usage

```
ch_slice(doy, step)
```

Arguments

doy A vector of the day of calendar year for the dataset

step Width of bin in days

Value

Returns a vector of bin numbers that is used as a factor for each day in the dataset and provides a message indicating the handling of partial bins

ch_sub_set_Years 55

Author(s)

Paul Whitfield, Kevin Shook

See Also

```
ch_binned_MannWhitney ch_flow_raster_trend
```

Examples

```
doy <- c(1:365)
# first 30 days are 1, 31-60 are 2 etc
dice <- ch_slice(doy, 30)
plot(doy, dice)</pre>
```

ch_sub_set_Years

Helper function for selecting points for an axis

Description

Sub-samples a vector every n places. Many times there are so many years the labels on the plot overlap. ch_sub_set_years returns the position and label for the subset. The function can be used on any type of simple array.

Usage

```
ch_sub_set_Years(years, n)
```

Arguments

years a vector of years
n sample size

Value

a list containing:

position array of axis positions label array of labels

Author(s)

Paul Whitfield

Examples

```
myears <- c(1900:2045)
myears <- ch_sub_set_Years(myears, 20)
myears

a <- LETTERS
my_alpha <- ch_sub_set_Years(a, 5)
my_alpha</pre>
```

ch_tidyhydat_ECDE

Converts a tidyhydat daily flow data tibble to ECDE format

Description

Accessing daily flow data using **tidyhydat** is quick and efficient. However, it sometimes conflicts with other functions as **tidyhydat** changes variable names and some default entries. This function converts a tibble obtained from a **tidyhydat** tibble to a dataframe with standard Environment and Climate Change Canada Data Explorer (ECDE) names.

Usage

```
ch_tidyhydat_ECDE(data)
```

Arguments

data

Tibble of daily flows retrieved using **tidyhydat** function hy_daily_flows.

Value

A dataframe or a list of flows with formats consistent with datafiles read using ch_read_ECDE_flows:

ID stationID

PARAM Parameter 1 for Flow 2 for Level

Date Original charater string converted to date format

Flow Daily mean flow m³/sec

SYM Quality flag

Author(s)

Paul Whitfield

See Also

```
ch_tidyhydat_ECDE_meta
```

Examples

```
# This example uses the built-in test database, by setting the hydat_path parameter
# You will want to use it with your actual HYDAT database
library(tidyhydat)
# check for existence of test database
test_db <- hy_test_db()</pre>
if (file.exists(test_db)) {
  hydat_path = hy_set_default_db(test_db)
  mdata <- hy_daily_flows(station_number=c("05AA008"))</pre>
  m_data <- ch_tidyhydat_ECDE(mdata)</pre>
  mdata <- hy_daily_flows(station_number=c("05AA008", "08MF005", "05HD008"))</pre>
  mnew <- ch_tidyhydat_ECDE(mdata)</pre>
  str(mnew[[1]])
  str(mnew[[2]])
  str(mnew[[3]])
# note the order is in increasing alphabetical order
                            # Reset HYDAT database
hy_set_default_db(NULL)
```

ch_tidyhydat_ECDE_meta

Creates an ECDE-like dataframe of metadata from tidyhydat

Description

Extracts tombstone (meta) data for stations from **tidyhydat** in a format similar to that used by the Environment Canada Data Explorer (ECDE). The default does not capture all the fields in ECDE, which includes the most recent status of many fields such as operating schedule. Returning these values slows the function, particularly when all WSC stations are selected.

Usage

```
ch_tidyhydat_ECDE_meta(stations, all_ECDE = FALSE)
```

Arguments

stations

A vector of WSC station IDs, i.e. c("05BB001", "05BB003", "05BB004", "05BB005"). If stations = "all" then values are returned for all stations. Note that you should ensure that that the **tidyhydat** database is up to date, if you select stations = "all", so that the most recent set of stations is used.

all_ECDE

Should all ECDE values be returned? If FALSE the default, then values of Flow, Level, Sed, OperSched, Region, Datum, and Operator are omitted or will differ from the ECDE values. If all_ECDE = TRUE, then the function will return values identical to ECDE. Note that setting all_ECDE = TRUE will result in very long execution times, as it is necessary to extract many daily values for each station to determine the values of Flow, Level, Sed, and OperSched to determine the final values.

Value

Returns a list with three items:

- meta a dataframe of metadata from **tidyhydat** in ECDE form (not all ECDE fields are reproduced in this summary)
- H_version version information, and
- th_meta a dataframe with all **tidyhdat** fields including:
 - Station StationID
 - StationName Station Name
 - HYDStatus Active or Discontinued
 - Prov Province
 - Latitude
 - Longitude
 - DrainageArea km²
 - Years number of years with data
 - From Start Year
 - To End Year
 - Reg. Regulated?
 - Flow not captured (differs from ECDE), unless all_ECDE = TRUE
 - Level not captured (differs from ECDE), unless all_ECDE = TRUE
 - Sed not captured (differs from ECDE), unless all_ECDE = TRUE
 - OperSched not captured (differs from ECDE), unless all_ECDE = TRUE
 - RealTime if TRUE/Yes
 - RHBN if TRUE/Yes is in the reference hydrologic basin network
 - Region number of region instead of name (differs from ECDE), unless all_ECDE = TRUE
 - Datum reference number (differs from ECDE), unless all_ECDE = TRUE
 - Operator reference number (differs from ECDE), unless all_ECDE = TRUE

## End(Not run)
```

ch_tr_sign

ch_tr_sign

Description

Converts MK (or other) slopes to integers 1-2-3 (negative, none, positive). These indices can be used to indicate trend direction.

Usage

```
ch_tr_sign(x, offset = 2)
```

Arguments

x an array of slopes

offset the amount of shift to make values positive integers, default is 2.

Value

Returns an array of indices (1, 2, 3)

Author(s)

Paul Whitfield

```
mkin <- c( -0.23, 0.34, 0.0, .033, -0.55)
mkout <- ch_tr_sign(mkin)
# 1 3 2 3 1
```

ch_tr_signif()

Description

Convert pvalues to integers 1 for NS and 2 for significant using a pvalue that can be set (default is 0.05)

Usage

```
ch_tr_signif(x, pvalue = 0.05)
```

Arguments

Х

an array of pvalues from statistical test

pvalue

critical value, default is 0.05

Value

Returns an array of indices 1 and 2, where 1 is NS and 2 is significant

Author(s)

Paul Whitfield

Examples

```
sin <- c( -0.052, 0.34, 0.012, -.033, -0.55)
sout <- ch_tr_signif(sin)
# 1 1 2 2 1</pre>
```

Description

Creates a file of pour points for the volcano DEM. The pour points define the outlets of sub-basins. These pour points are used by examples within other functions.

Usage

```
ch_volcano_pourpoints(pp_shp)
```

Arguments

pp_shp

Name for shapefile to hold pour points

ch_volcano_raster 61

Value

Returns an **sf** object containing 2 pour points for the volcano DEM. The pour points are also written to the specified file.

Author(s)

Dan Moore and Kevin Shook

See Also

```
ch_volcano_raster ch_wbt_pourpoints
```

Examples

```
pourpoint_file <- tempfile("volcano_pourpoints", fileext = c(".shp"))
pourpoints <- ch_volcano_pourpoints(pourpoint_file)
plot(pourpoints)</pre>
```

ch_volcano_raster

Create Test Raster

Description

Creates a **raster** object of land surface elevations, as used to test/demonstrate many functions requiring a digital elevation model (DEM).

Usage

```
ch_volcano_raster()
```

Details

No arguments are required as the DEM is created from the base volcano matrix of elevations.

Value

Returns a raster object of land surface elevations.

Author(s)

Dan Moore and Kevin Shook

```
test_raster <- ch_volcano_raster()</pre>
```

62 ch_wbt_catchment

ch_wbt_catchment

Delineate catchment boundaries

Description

Delineate catchment boundaries

Usage

```
ch_wbt_catchment(
   fn_pp_snap,
   fn_flowdir,
   fn_catchment_ras,
   fn_catchment_vec,
   return_vector = TRUE
)
```

Arguments

```
fn_pp_snap Name of file containing snapped pour points

fn_flowdir Name of file containing flow accumulations.

fn_catchment_ras

Raster file to contain delineated catchment.

fn_catchment_vec

Vector file to contain delineated catchment.

return_vector If TRUE (the default) a vector of the catchment will be returned.
```

Value

If return_vector == TRUE a vector of the catchment is returned. Otherwise nothing is returned.

Author(s)

Dan Moore and Kevin Shook

```

ch_wbt_catchment_onestep

Delineates a catchment in a single step

Description

Calls all of the ch_wbt and other functions required to do the sub-tasks required to delineate a catchment. The names of files to be created are taken from the list created by the function ch_wbt_filenames.

Usage

```
ch_wbt_catchment_onestep(
   wd,
   in_dem,
   pp_sf,
   sink_method = "breach_leastcost",
   dist = NULL,
   check_catchment = TRUE,
   threshold = NULL,
```

```
snap_dist = NULL,
cb_colour = "red",
pp_colour = "red",
channel_colour = "blue",
contour_colour = "grey",
plot_na = TRUE,
plot_scale = TRUE,
na_location = "tr",
scale_location = "bl",
...
```

Arguments

wd Name of working directory.
in_dem File name for original DEM.
pp_sf Vector containing pour points.

sink_method Method for sink removal as used by ch_wbt_removesinks.

dist Maximum search distance for breach paths in cells. Required if sink_method =

"breach_leastcost".

check_catchment

If TRUE (the default) ch_checkcatchment will be called after the catchment is

created.

threshold Threshold for channel initiation.

snap_dist Maximum pour point snap distance in map units.

cb_colour Colour for catchment outline. Default is "red".

pp_colour Colour for catchment pour points. Default is "red".

channel_colour Colour for channel. Default is "blue". contour_colour Colour for contours Default is "grey".

plot_na If TRUE (the default) a north arrow is added to the plot.
plot_scale If TRUE (the default) a scale bar is added to the plot.

na_location Location for the north arrow. Default is 'tr', i.e. top-right. scale_location Location for the scale bar. Default is 'bl', i.e. bottom-left.

... Extra parameters for ch_wbt_removesinks.

Value

Returns an sp object of the delineated catchment.

}
```

ch_wbt_channels

Generate stream network

Description

Generate stream network

Usage

```
ch_wbt_channels(
   fn_flowacc,
   fn_flowdir,
   fn_channel_ras,
   fn_channel_vec,
   threshold = NULL,
   ...
)
```

Arguments

```
fn_flowdir File name for flow accumulation grid.

fn_flowdir File name for flow direction grid.

fn_channel_ras File name for raster version of channel network.

fn_channel_vec File name for vector version of channel networks.

threshold Threshold for channel initiation.

Other parameters for whitebox function wbt_extract_streams
```

Value

Returns a sf vector object of the stream channels.

 channel_vector_file, 1)
 plot(channels)
} else {
 message("Examples not run as Whitebox executable not found")
}
```

ch_wbt_filenames

Creates names for Whitebox function input and output files

Description

Creates a list of the files used for inputs and outputs by the Whitebox functions. This function needs to be called before calling any of the other Whitebox (i.e. those prefixed by cd_wbt) functions. If the file names are not specified, default names will be used. All raster files are TIFF (.tif), all vector files are shapefiles (.shp).

Usage

```
ch_wbt_filenames(
  wd = NULL,
```

ch_wbt_filenames 67

```
fn_dem = "dem.tif",
  fn_dem_fsc = "dem_fsc.tif",
  fn_dem_ns = "dem_ns.tif",
  fn_flowacc = "flow_acc.tif",
  fn_flowdir = "flow_dir.tif",
  fn_channel_ras = "channel.tif",
  fn_channel_vec = "channel.shp",
  fn_catchment_ras = "catchment.tif",
  fn_catchment_vec = "catchment.shp",
  fn_pp = "pp.shp",
  fn_pp_snap = "pp_snap.shp"
)
```

Arguments

wd	Required. Name of working directory.	
fn_dem	File name of input DEM. Default is 'dem.tif'.	
fn_dem_fsc	File name for dem after filling single-cell pits. Default is 'dem_fsc.tif'.	
fn_dem_ns	File name for dem removing sinks. Default is 'dem_ns.tif'.	
fn_flowacc	File name for DEM flow accumulation grid Default is 'flow_acc.tif'.	
fn_flowdir	File name for DEM flow direction grid. Default is 'flow_dir.tif'.	
<pre>fn_channel_ras</pre>	File name for raster version of channel network. Default is 'channel.tif'.	
<pre>fn_channel_vec</pre>	File name for vector version of channel networks. Default is 'channel.shp'.	
fn_catchment_ras		
	File name for raster version of catchment. Default is 'catchment.tif'.	
fn_catchment_vec		
	File name for vector version of catchment. Default is 'catchment.shp'.	
fn_pp	File name for pour points (input). Vector file. Default is 'pp. shp'.	
fn_pp_snap	File name for pour points after snapping to channel network. Vector file. Default is 'pp. shp'.	

Value

Returns a list of the input and output file names

Author(s)

Dan Moore

```
wbt_file_names <- ch_wbt_filenames(getwd())</pre>
```

ch_wbt_flow_accumulation

Creates flow accumulation grid file

Description

Creates flow accumulation grid file

Usage

```
ch_wbt_flow_accumulation(fn_dem_ns, fn_flowacc, return_raster = TRUE)
```

Arguments

fn_dem_ns File name of dem with sinks removed.

fn_flowacc File name for flow accumulation grid to be created.

return_raster If TRUE (the default), the flow accumulation grid will be returned as a raster

object, in addition to being written to 'fn_flowacc'. If FALSE, the output file

will still be created but a NULL value is returned.

Value

If return_raster = TRUE, the flow accumulation grid will be returned as a raster object, otherwise NULL is returned.

Author(s)

Dan Moore

```
# Only proceed if Whitebox executable is installed
library(whitebox)
if (check_whitebox_binary()){
    library(raster)
    test_raster <- ch_volcano_raster()
    dem_raster_file <- tempfile(fileext = c(".tif"))
    no_sink_raster_file <- tempfile("no_sinks", fileext = c(".tif"))

# write test raster to file
    writeRaster(test_raster, dem_raster_file, format = "GTiff")

# remove sinks
removed_sinks <- ch_wbt_removesinks(dem_raster_file, no_sink_raster_file, method = "fill")

# get flow accumulations
flow_acc_file <- tempfile("flow_acc", fileext = c(".tif"))
flow_acc <- ch_wbt_flow_accumulation(no_sink_raster_file, flow_acc_file)</pre>
```

ch_wbt_flow_direction 69

```
plot(flow_acc)
} else {
  message("Examples not run as Whitebox executable not found")
}
```

ch_wbt_flow_direction Creates flow direction grid file

Description

Creates flow direction grid file

Usage

```
ch_wbt_flow_direction(fn_dem_ns, fn_flowdir, return_raster = TRUE)
```

Arguments

fn_dem_ns File name of dem with sinks removed.

fn_flowdir File name for flow direction grid to be created.

return_raster Should a raster object be returned?

Value

If return_raster = TRUE (the default), the flow direction grid will be returned as a raster object, in addition to being written to 'fn_flowdir'. If return_raster = FALSE, the output file will still be created but a NULL value is returned.

Author(s)

Dan Moore

```
# Only proceed if Whitebox executable is installed
library(whitebox)
if (check_whitebox_binary()){
    library(raster)
    test_raster <- ch_volcano_raster()
    dem_raster_file <- tempfile(fileext = c(".tif"))
    no_sink_raster_file <- tempfile("no_sinks", fileext = c(".tif"))

# write test raster to file
    writeRaster(test_raster, dem_raster_file, format = "GTiff")

# remove sinks
removed_sinks <- ch_wbt_removesinks(dem_raster_file, no_sink_raster_file, method = "fill")

# get flow directions</pre>
```

70 ch_wbt_pourpoints

```
flow_dir_file <- tempfile("flow_dir", fileext = c(".tif"))
  flow_dir <- ch_wbt_flow_direction(no_sink_raster_file, flow_dir_file)
  plot(flow_dir)
} else {
  message("Examples not run as Whitebox executable not found")
}</pre>
```

ch_wbt_pourpoints

Snap pour points to channels

Description

Pour points describe the outlets of sub-basins within a DEM. To use the pour points to delineate catchments, they must align with the drainage network. This function snaps (forces the locations) of pour points to the channels.

Usage

```
ch_wbt_pourpoints(
   pp_sf = NULL,
   fn_flowacc,
   fn_pp,
   fn_pp_snap,
   check_crs = TRUE,
   snap_dist = NULL,
   ...
)
```

Arguments

pp_sf	sf object containing pour points. These must be supplied by the user. See the code in ch_volcano_pourpoints for an example of creating the object.
fn_flowacc	Name of file containing flow accumulations.
fn_pp	File name to create un-snapped pour points.
fn_pp_snap	File name for snapped pour points.
check_crs	If TRUE the projections of the pour points and flow accumulation files will be checked to ensure they are identical.
snap_dist	Maximum snap distance in map units.
	Additional parameters for whitebox function wbt_snap_pour_points.

Value

Returns a sf object of the specified pour points snapped to the channel network.

 pourpoints <- ch_volcano_pourpoints(pourpoint_file)</pre>
 snapped_pourpoint_file <- tempfile("snapped_pourpoints", fileext = c(".shp"))</pre>
 snapped_pourpoints <- ch_wbt_pourpoints(pourpoints, flow_acc_file, pourpoint_file,</pre>
 snapped_pourpoint_file, snap_dist = 10)
} else {
 message("Examples not run as Whitebox executable not found")
```

ch_wbt_removesinks

Removes sinks from a DEM

Description

Sinks are removed from a DEM using one of several methods. The raster file types supported are listed in Spatial_hydrology_functions.

Usage

```
ch_wbt_removesinks(
  in_dem,
  out_dem,
  method = "breach_leastcost",
  dist = NULL,
  fn_dem_fsc = NULL,
```

72 ch_wbt_removesinks

```
)
```

Arguments

Value

Returns a raster object containing the processed dem.

Author(s)

Dan Moore

```
# Only proceed if Whitebox executable is installed
library(whitebox)
if (check_whitebox_binary()){
    library(raster)
    test_raster <- ch_volcano_raster()
    dem_raster_file <- tempfile(fileext = c(".tif"))
    no_sink_raster_file <- tempfile("no_sinks", fileext = c(".tif"))

# write test raster to file
    writeRaster(test_raster, dem_raster_file, format = "GTiff")

# remove sinks

} else {
    message("Examples not run as Whitebox executable not found")
}</pre>
```

ch_wtr_yr

ch_wtr_yr

Designation of the water year

Description

Display water year

Usage

```
ch_wtr_yr(dates, start_month = 10)
```

Arguments

dates A vector of dates with actual year

start_month Month in which the year starts (defaults to October)

Value

Year starting in start_month

Source

http://stackoverflow.com/questions/27626533/r-create-function-to-add-water-year-column

Examples

```
date <- seq(as.Date("1910/1/1"), as.Date("1912/1/1"), "days")
wtr_yr_date <- ch_wtr_yr(dates=date, start_month=10)
df <- data.frame(wtr_yr_date, date)</pre>
```

flowAtlantic

Annual maxima from sites in the Atlantic region of Canada

Description

Contains the annual maxima of 45 hydrometric stations found in the region '01' of Water Survey of Canada. In additional to the annual maxima, the output list includes catchment descriptors (longitude, latitude, basin area, mean annual precipitation) and the geographical distance between each station.

Usage

flowAtlantic

Format

An object of class list of length 2.

Spatial_hydrology_functions

Spatial Hydrology functions

Description

These functions perform spatial analyses important in hydrology. All of the functions with the prefix ch_wbt require the installation of the package **Whitebox**. The functions include:

ch_wbt_removesinks Removes sinks from a DEM by deepening drainage network

ch_wbt_fillsinks Removes sinks from a DEM by filling them

ch_wbt_catchment Generates catchment boundaries for a conditioned DEM based on specified points of interest

ch_wbt_channels Generates a drainage network from DEM

ch_wbt_flow_accumulation Accumulates flows downstream in a cathement

ch_wbt_flow_direction Calculated flow directions for each cell in DEM

ch_wbt_pourpoints Snaps pour points to channel

ch_wbt_catchment_onestep Performs all catchment delineations in a single function

ch contours Creates contour lines from DEM

ch checkcatchment Provides a simple map to check the outputs from ch saga catchment

ch_checkchannels Provides a simple map to check the outputs from ch_saga_channels

ch_volcano_raster Returns a raster object of land surface elevations

The **Whitebox** functions support the following file types for raster data:

type extension

GeoTIFF *.tif, *.tiff

Big GeoTIFF *.tif, *.tiff

Esri ASCII *.txt, *.asc

Esri BIL *.flt, *.hdr

GRASS ASCII *.txt, *.asc

Idrisi *.rdc, *.rst

SAGA Binary *.sdat, *.sgrd

Surfer ASCII *.grd

Surfer Binary *.grd

Whitebox *.tas, *.dep

76 Visualization-functions

StatisticalHydrology-functions

Statistical analysis functions

Description

These functions perform statistical analyses

ch_binned_MannWhitney Compares two time periods of data using Mann-Whitney test

ch_fdcurve Finds flow exceedence probabilities

ch_get_peaks Finds peak flows over a specified threshold

Visualization-functions

Visualization functions

Description

These functions are primarily intended for graphing, although some analyses may also be done.

ch_booth_plot Plot of peaks over a threshold

ch_flow_raster Raster plot of streamflows

ch_flow_raster_qa Raster plot of streamflows with WSC quality flags

ch_flow_raster_trend Raster plot and simple trends of observed streamflows

ch_hydrograph_plot Plots hydrographs and/or precipitation

ch_polar_plot Polar plot of daily streamflows

ch_regime_plot Plots the regime of daily streamflows
