

Package ‘GEOmap’

July 21, 2025

Type Package

Title Topographic and Geologic Mapping

Version 2.5-11

Date 2024-07-09

Depends R (>= 3.0)

Imports RPMG, fields, sf, MBA

Suggests geomapdata, maps

LazyData yes

Author Jonathan M. Lees [aut, cre]

Maintainer Jonathan M. Lees <jonathan.lees@unc.edu>

Description Set of routines for making map projections (forward and inverse), topographic maps, perspective plots, geological maps, geological map symbols, geological databases, interactive plotting and selection of focus regions.

License GPL (>= 2)

NeedsCompilation yes

Repository CRAN

Examples

```
##### projections
proj = setPROJ(type = 2, LAT0 =23, LON0 = 35)

### get lat-lon
LL = XY.GLOB(200, 300, proj)

## find x-y again, should be the same
XY = GLOB.XY(LL$lat, LL$lon, proj)
XY
#####
library(geomapdata)
data(worldmap)
KAMlat = c(48.5, 65)
KAMlon = c(150, 171)
```

```

PLOC=list(LON=KAMlon,LAT=KAMlat)

PLON = seq(from=KAMlon[1], to=KAMlon[2], by=2)
PLAT = seq(from=KAMlat[1], to=KAMlat[2], by=2)

proj = setPROJ(2, LON0=mean(KAMlon), LAT0=mean(KAMlat))

xy = GLOB.XY(KAMlat, KAMlon , proj)
kbox=list(x=range(xy$x, na.rm=TRUE), y=range(xy$y, na.rm=TRUE))

plot(kbox$x,kbox$y, type='n', axes=FALSE, xlab="", ylab="", asp=1)
  plotGEOMapXY(worldmap, LIM=c(KAMlon[1], KAMlat[1], KAMlon[2],
KAMlat[2]), add=TRUE, PROJ=proj, axes=FALSE, xlab="", ylab="")

sqrTICXY(kbox , proj, side=c(1,2,3,4), LLgrid=TRUE, col=grey(.7) )
title("Crude Map of Kamchatka")

```

addLLXY

Add Lat-Lon points using projection

Description

Add Lat-Lon points using projection

Usage

```

addLLXY(lats, lons, PROJ = PROJ, PMAT = NULL,
col = gray(0.7), GRID = TRUE, GRIDcol = 1, LABS = NULL,
LABcol = 1, BORDER = NULL, TICS = c(1, 1), xpd=TRUE)

```

Arguments

lats	Latitudes in Degrees
lons	Longitude in Degrees
PROJ	Map Projection list
PMAT	Perspective matrix conversion
col	color
GRID	logical, TRUE=add grid lines
GRIDcol	color for grid lines
LABS	vector of labels
LABcol	color for labels
BORDER	add border
TICS	tick marks
xpd	logical, expand plotting region (see par)

Value

Graphical Side Effects

Author(s)

Jonathan M. Lees<jonathan.lees.edu>

See Also

plotGEOMapXY, sqrtTICXY

Examples

```
library(geomapdata)

data('fujitopo', package='geomapdata')
data('japmap', package='geomapdata')

max(A$LON))

addLLXY(PLAT, PLON, PROJ=PROJ, LABS=TRUE, PMAT=NULL, TICS=c(.1,.1) )

#####
```

addTIX

Add Tic marks to map

Description

Add Tic marks to map

Usage

```
addTIX(lats, lons, PROJ = list(), PMAT = NULL,
col = gray(0.7), TICS = c(1, 1), OUTER = TRUE,
sides = c(1, 2, 3, 4))
```

Arguments

lats	Latitudes in Degrees
lons	Longitude in Degrees
PROJ	Map Projection list
PMAT	Perspective matrix conversion
col	color
TICS	tic labels
OUTER	logical
sides	sides, 1,2,3,4

Details

attempts to make correct default values

Value

plot(gxy$x, gxy$y, asp=TRUE)

addTIX(PLAT, PLON, PMAT=NULL, col='red', TICS=c(.1,.1), PROJ=PROJ)

```

along.great

Along A great Arc

Description

Calculate points along a great arc

Usage

```
along.great(phi1, lam0, c, Az)
```

Arguments

phi1	start lat, radians
lam0	start lon, radians
c	distance, radians
Az	Azimuthal direction, radiansm

Details

All input and output is radians

Value

List:

phi	latitudes, radians
lam	longitudes, radians

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

Examples

```
lat1 <- 48.856578
lon1 <- 2.351828

A = along.great(lat1*pi/180, lon1*pi/180, 50*pi/180, -63*pi/180)

lat=A$phi*180/pi
lon = A$lam*180/pi
```

antipolygon	<i>Fill the complement of a polygon</i>
-------------	---

Description

Fill a plot with a color outside the confines of a polygon.

Usage

```
antipolygon(x, y, col = 0, corner=1, pct=.4)
```

Arguments

x	x coordinates of polygon
y	y coordinates of polygon
col	Fill color
corner	Corner on the plot to connect to at the end: 1 = LowerLeft(default) ; 2:UpperLeft 3 = UpperRight; 4=LowerRight
pct	Decimal percent of usr coordinates to expand beyond the polygon

Details

antipolygon uses par("usr") to determine the external bounds of plotting region. Corners are labels from bottom left counter-clockwise, 1-4.

Value

List:

x	x-coordinates of mask
y	y-coordinates of mask

Used for graphical side effect

Note

If the figure is resized after plotting, filling may not appear correct.

Author(s)

Jonathan M. Lees <jonathan.lees@unc.edu>

See Also

polygon, par

Examples

```
set.seed(2018)
x = runif(100)
y = runif(100)

##### some data points to plot:

plot(x,y)
##### create polygon:
pp =list(x=c(0.231,0.316,0.169,0.343,0.311,0.484,0.757,
            0.555,0.800,0.563,0.427,0.412,0.203),
        y=c(0.774,0.622,0.401,0.386,0.138,0.312,0.200,0.459,
            0.658,0.624,0.954,0.686,0.813))

polygon(pp)

antipolygon(x=pp$x, y=pp$y,col='blue')
#### where as this does not look so good
plot(x,y)
antipolygon(x=pp$x, y=pp$y,col='blue', corner=2)
```

BASICTOPOMAP

Basic Topogrpahy Map

Description

Basic Topogrpahy Map

Usage

```
BASICTOPOMAP(xo, yo, DOIMG, DOCONT, UZ, AZ, IZ, perim, PLAT, PLON,
PROJ = PROJ, pnts = NULL, GRIDcol = NULL)
```

Arguments

xo	vector of x-coordinates
yo	vector of y-coordinates
DOIMG	logical, add image
DOCONT	logical, add contours
UZ	matrix of image values under sea level
AZ	matrix of image values above sea level
IZ	matrix of image values
perim	perimeter vectors
PLAT	latitudes for tic-marks
PLON	longitude for tic-marks
PROJ	projection list
pnts	points to add to plot
GRIDcol	color for grid

Details

Image is processed prior to calling

Value

Graphical Side effects

## End(Not run)
```

bcars	<i>Plot Box Cars</i>
-------	----------------------

Description

Add Box Cars to a line.

Usage

```
bcars(x, y, h1 = 1, h2 = 0.3, rot, col = "black", border = "black")
```

Arguments

x	x-coordinates
y	y-coordinates
h1	length, mm
h2	thickness, mm
rot	rotation vectors, (cosines and sines)
col	color
border	color

Details

Used for plotting detachment faults in USGS format.

Value

```

boundGEomap

Set Bounds for GEomap

Description

Given a GEomap strucutre, set the bounds for the strokes.

Usage

```
boundGEomap(MAP, NEGLON = FALSE, projtype = 2)
```

Arguments

MAP	GEOmap structure
NEGLON	whether to allow negative longitudes
projtype	suggestion (local) map projection to use when getting bounds

Details

Used to rectify a new map after reading in from ascii file. Can take GMT map ascii map files and convert to GEOmap.

Value

List structure:

STROKES	list(nam, num, index, col, style, code, LAT1, LAT2, LON1, LON2)
POINTS	list(lat, lon)
PROJ	list(type, LAT0, LON0, LAT1, LAT2, LATS, LONS, DLAT, DLON, FE, FN, name)

Author(s)

Jonathan M. Lees<jonathan.lees.edu>

See Also

worldmap

Examples

```
library(geomapdata)
data(worldmap)
worldmap = boundGEOmap(worldmap)
```

CCcheck

Counter Clockwise check

Description

Check for counter-clockwise orientation for polygons. Positive is counterclockwise.

Usage

```
CCcheck(Z)
```

Arguments

Z list(x,y)

Details

Uses sign of the area of the polygon to determine polarity.

Value

j sign of area

Note

Based on the idea calculated area of a polygon.

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

Examples

```
Y=list()
Y$x=c(170,175,184,191,194,190,177,166,162,164)
Y$y=c(-54,-60,-60,-50,-26,8,34,37,10,-15)

plot(c(160, 200),c(-85, 85), type='n')
points(Y)
lines(Y)

CCcheck(Y)

Z = list(x=rev(Y$x), y=rev(Y$y))

CCcheck(Z)
```

Description

Used for determining if points are in polygons.

Usage

```
ccw(p0, p1, p2)
```

Arguments

p0 point 0
p1 point 1
p2 point 2

Value

returns 1 or 0 depending on position of points

Author(s)

Jonathan M. Lees <jonathan.lees@unc.edu>

See Also

Lintersect

Examples

```
l1 = list(p1=list(x=0, y=0), p2=list(x=1,y=1))  
l2 = list(p1=list(x=6, y=4), p2=list(x=-1,y=-12))  
  
ccw(l1$p1, l1$p2, l2$p1)
```

coastmap	<i>Global Coast Map</i>
----------	-------------------------

Description

Global Maps of Coast

Usage

```
data(coastmap)
```

Format

List structure:

STROKES list(nam, num, index, col, style, code, LAT1, LAT2, LON1, LON2)

POINTS list(lat, lon)

PROJ list(type, LAT0, LON0, LAT1, LAT2, LATS, LONS, DLAT, DLON, FE, FN, name)

Details

This map list is used for filling in coastal lines for global maps. The style=3 is for filling in polygons. The strokes are named for easier access to particular parts of the globe. Asia and Africa are one stroke, as are North and South America. there are currently three codes: C=major coast, c=smaller coasts, L=interior lakes.

Examples

```
data(coastmap)
##### see the codes:
unique(coastmap$STROKES$code)
##### see the different names:
unique(coastmap$STROKES$nam)

##### change the colors based on code
coastmap$STROKES$col[coastmap$STROKES$code=="C" ] = rgb(1, .6, .6)
coastmap$STROKES$col[coastmap$STROKES$code=="c" ] = rgb(1, .9, .9)
coastmap$STROKES$col[coastmap$STROKES$code=="L" ] = rgb(.6, .6, 1)

plotGE0map(coastmap , border='black' , add=FALSE, xaxs='i')
```

##

darc	<i>Circular Arc</i>
------	---------------------

Description

Draw acircular arc from angle 1 to angle 2 at a given location.

Usage

```
darc(rad = 1, ang1 = 0, ang2 = 360, x1 = 0, y1 = 0, n = 1)
```

Arguments

rad	radius
ang1	angle 1, degrees
ang2	angle 2, degrees
x1	x location, plot coordinates
y1	y location, plot coordinates
n	increment for number of segments, degrees

Details

If $\text{angle1} > \text{angle2}$ arc is drawn in opposite direction

Value

`list(x,y)`

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

Examples

```
plot(c(0,1), c(0,1), type='n', ann=FALSE, asp=1)
```

```
A = darc(.3, 23, 47, .5, .5, n=1)
```

```
lines(A$x, A$y)
```

DATUMinfo

Datum information.

Description

Return a small data base of Datum values for use in UTM projections.

Usage

```
DATUMinfo()
```

Details

The function just return a list with the relevant information.

Value

List:

Datum	character name
Equatorial Radius, meters (a)	
	numeric
Polar Radius, meters (b)	
	numeric
Flattening (a-b)/a	
	numeric
Use	character usage

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

References

stevedutch.net

See Also

UTM.xy, UTM.ll, setPROJ

Examples

```
h = DATUMinfo()
data.frame(h)
```

demcmap

Color Map from DEM

Description

create a color map from a DEM (Digital Elevation Map)

Usage

```
demcmap(ZTOPO, n = 100, ccol = NULL)
```

Arguments

ZTOPO	Topography structure
n	number of colors
ccol	color structure

Value

vector of rgb colors

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

See Also

rgb, settopocol

difflon	<i>Difference between Longitudes</i>
---------	--------------------------------------

Description

Difference between Longitudes

Usage

```
difflon(LON1, LON2)
```

Arguments

LON1	Longitude in degrees
LON2	Longitude in degrees

Details

takes into account crossing the zero longitude

Value

deg	degrees difference
sn	direction of rotation

Author(s)

Jonathan M. Lees<jonathan.lees.edu>

Examples

```

```

distaz	<i>Distance and Azimuth from two points</i>
--------	---

Description

Calculate distance, Azimuth and Back-Azimuth from two points on Globe.

Usage

```
distaz(olat, olon, tlat, tlon)
```

Arguments

olat	origin latitude, degrees
olon	origin longitude, degrees
tlat	target latitude, degrees
tlon	target longitude, degrees

Details

Program is set up for one origin (olat, olon) pair and many target (tlat, tlon) pairs given as vectors.

If multiple olat and olon are given, the program returns a list of outputs for each.

If olat or any tlat is greater than 90 or less than -90 NA is returned and error flag is 0.

If any tlat and tlon is equal to olat and olon, the points are coincident. In that case the distances are set to zero, but the az and baz are NA, and the error flag is set to 0.

Value

List:

del	Delta, angle in degrees
az	Azimuth, angle in degrees
baz	back Azimuth, (az+180) in degrees
dist	distance in km
err	0 or 1, error flag. 0=error, 1=no error, see details

Examples

```
#### one point
d = distaz(12, 23, -32, -65)
d

#### many random target points
org = c(80.222, -100.940)
targ = cbind(runif(10, 10, 50), runif(10, 20, 100))

distaz(org[1], org[2], targ[,1], targ[,2])

##### if origin and target are identical
##### the distance is zero, but the az and baz are not defined
distaz(80.222, -100.940, 80.222, -100.940)

##### set one of the targets equal to the origin
targ[7,1] = org[1]
targ[7,2] = org[2]

distaz(org[1], org[2], targ[,1], targ[,2])

#### put in erroneous latitude data

targ[3,1] = -91.3

distaz(org[1], org[2], targ[,1], targ[,2])
```

dms

Convert decimal degrees to degree, minutes, seconds

Description

Convert decimal degrees to degree, minutes, seconds

Usage

```
dms(d1)
```

Arguments

d1 decimal degrees

Value

list	
d	degrees
m	minutes
s	seconds

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

Examples

```
dms(33.12345)

H = dms(-91.8765)

print(H)

newH = H$d+H$m/60+H$s/3600
print(newH)
```

DUMPLOC

DUMP vectors to screen in list format

Description

For saving vectors to a file after the locator function has been executed.

Usage

```
DUMPLOC(zloc, dig = 12)
```

Arguments

zloc	x,y list of locator positions
dig	number of digits in output

Value

Side effects: print to screen

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

Examples

```

```

EHB.LLZ

*Earthquake Location Data***Description**

Global Earthquake catalog locations from Engdahl, et al.

Usage

```
data(EHB.LLZ)
```

Format

lat Latitude
lon Longitude
z depth in km

Source

Data is extracted from an earthquake data base of relocated events provided by Robert Engdahl.

References

Engdahl, E. R., R. D. van der Hilst, S. H. Kirby, G. Ekstrom, K. M. Shedlock, and A. F. Sheehan (1998), A global survey of slab structures and internal processes using a combined data base of high-resolution earthquake hypocenters, tomographic images and focal mechanism data, *Seismol. Res. Lett.*, 69, 153-154.

Examples

```
data(EHB.LLZ)
## maybe str(EHB.LLZ) ; plot(EHB.LLZ) ...
```

Ellipsoidal.Distance	<i>Ellipsoidal Distance</i>
----------------------	-----------------------------

Description

Ellipsoidal Distance given Latitude and Longitude

Usage

```
Ellipsoidal.Distance(olat, olon, tlat, tlon, a = 6378137, b = 6356752.314, tol=10-12)
```

Arguments

olat	Origin Latitude, degrees
olon	Origin Longitude, degrees
tlat	Target Latitude, degrees
tlon	Target Longitude, degrees
a	major axis, meters. If missing uses the
b	minor axis, meters
tol	Tolerance for convergence, default=10 ⁻¹²

Details

Uses Vincenty's formulation to calculate the distance along a great circle on an ellipsoidal body.

If a and b are not provided, they are set by default to a=6378137.0, b=6356752.314, the WGS-84 standard.

Only one pair of (olat, olon) and (tlat, tlon) can be given at a time. The program is not vectorized.

Quoting from the wiki page this algorithm was extracted from:

"Vincenty's formulae are two related iterative methods used in geodesy to calculate the distance between two points on the surface of an spheroid, developed by Thaddeus Vincenty in 1975. They are based on the assumption that the figure of the Earth is an oblate spheroid, and hence are more accurate than methods such as great-circle distance which assume a spherical Earth.

The first (direct) method computes the location of a point which is a given distance and azimuth (direction) from another point. The second (inverse) method computes the geographical distance and azimuth between two given points. They have been widely used in geodesy because they are accurate to within 0.5 mm (.020 sec) on the Earth ellipsoid"

Value

list	
dist	distance, km
az	azimuth, degrees
revaz	reverse azimuth, degrees
err	=0, if convergence failed, else=1

Note

Latitudes >90 and < -90 are not allowed. NA's are returned.

If points are identical, a distance of zero is returned and NA for the azimuths. If there is some problems with convergence or division by zero, NA's are returned and error message is printed.

A couple of known cases that do not work are, e.g.: (olat=0; olon=0; tlat=0; tlon=-180) and (olat=0; olon=0; tlat=0; tlon=180). They will return NA's to avoid division by zero.

I am not sure how to deal with these cases yet.

The reverse azimuth is the angle from the meridian on the target point to the great circle from the origin to the target (as far as I can tell). If distaz and Ellipsoidal.Distance are compared, they give the same azimuth, and the absolute angles of baz (from distaz) and revaz (from Ellipsoidal.Distance) will add to 180 degrees.

eqswath	<i>Extract a set of eathquakes in swath along a cross sectional line</i>
---------	--

Description

Extract a set of eathquakes in swath along a cross sectional line

Usage

```
eqswath(x, y, z, L, width = 1, PROJ = NULL)
```

Arguments

x	x-coordinates of earthquakes
y	y-coordinates of earthquakes
z	z-coordinates of earthquakes
L	list of x-y coordinates of cross section
width	width of swath (km)
PROJ	projection information

Details

All units should be the same.

Value

r	r-distance along cross section (x-coordinate)
dh	distance from cross section
depth	depth in cross section (y-coordinate)
flag	index vector of which earthquakes fell in swath and depth range
InvBox	coordinates of swath for plotting on map

expandbound

Expand Bounds

Description

Calculate an expanded bounding region based on a percent of the existing boundaries

Usage

```
expandbound(g, pct = 0.1)
```

Arguments

g	vector of values
pct	fractional percent to expand

Details

uses the range of the existing vector to estimate the expanded bound

Value

vector, new range

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

Examples

```
i = 5:10
exi = expandbound(i, pct = 0.1)
range(i)
range(exi)
```

explode

Explode Points

Description

Explode a set of points away from a center point

Usage

```
explode(fxy, dexplo=1, mult=1, cenx=0, ceny=0, PLOT=FALSE)
```

Arguments

fxy	list of x, y coordinates
dexplo	distance to explode
mult	multiplier for the distance
cenx	x coordinate center of explosion
ceny	y coordinate center of explosion
PLOT	logical, TRUE=make a plot of the resulting explosion

Details

If cenx and ceny is missing it is assumed to be the mean of the coordinates. Program calculates the new locations radiating away from the central point. No protection against overlapping symbols is included.

Value

list of new x,y values

x new x coordinates

y new y coordinates

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

arrows(NEW$x, NEW$y,NEW2$x, NEW2$y, col='green' )

##### try with a different center
cenx=-1; ceny=-1
NEW = explode(list(x=x,y=y), dexplo =1, cenx=cenx, ceny=keny)
plot(range(c(x,NEW$x)), range(c(y,NEW$y)), asp=1, type='n')
points(x,y, pch=3, col='red')
segments(x,y,NEW$x, NEW$y)
points(NEW$x, NEW$y, pch=6, col='blue', cex=2)
points(cenx, ceny, pch=8, col='purple')
text(cenx, ceny, labels="Center Point", pos=1)
```

ExplodeSymbols	<i>Explode symbols that overlap</i>
----------------	-------------------------------------

Description

Interactive program for redistributing symbols for later plotting. Used for Focal Mechanisms.

Usage

```
ExplodeSymbols(XY, fsiz = 1, STARTXY = NULL, MAP = NULL)
```

Arguments

XY	list of x,y values
fsiz	size of the symbol, as a percentage of the user coordinates
STARTXY	Starting positions. This is used for multiple sessions where we want to pick up the previous locations.
MAP	Map to plot on the screen, in GEOMap format.

Details

The program is interactive. It starts by plotting the points as symbols. A number of buttons are provided for exploding the points semi automatically. To move each point click near its current point, then click at the destination followed by a click on the HAND button. several symbols can be moved at the same time.

You must click on the screen and on the buttons to get this code working - the program will not work in batch mode or run as a script You click in the active screen area and then press a button on top (or bottom) - the button takes your clicks and does something Here are some hints:

Buttons:Buttons appear on top and bottom of the plotting region.

HAND: If you want to move only one symbol (focal mech) click near it and then click where you want it to go. Then click the HAND button You may click several at once, but for each click oin a symbol there has to be a click somewhere to relocate it. (i.e. there must be an even number of clicks on the screen before hitting the HAND button)

SEL: If you want to explode several symbols at once, first select them: click lower left, then upper right of rectangle enclosing the selection. Once a selection is made it remains active until another selection is made so you can keep changing the radius and center for different explosions Then click CIRC.

RECT Choose a rectangle (lower left and upper right), then click RECT for an explosion

RECT2 After selecting, choose a center and a distance. symbols will be moved to a rectangular perimeter defined by the two points

CIRC After selection, click once for the circle center, and a second time for the radius, then click CIRC

LINE After selection,will explode the events away from a line, a given distance away. The line is given by 2 points and the distance by a third perpendicular distance.

Value

list of new x,y values

Note

For now the map is given in lat-lon coordinates- the same as the points being moved. There is no map projection used.

```

gclc

*Global to local coordinates***Description**

OLD projection sometimes used in Lees' tomography. No need for projection data, it is included in the code.

Usage

```
gclc(phiorg, lamorg, phi, lam)
```

Arguments

phiorg	lat origin
lamorg	lon origin
phi	lat
lam	lon

Details

This may be defunct now.

Value

x	coordinate, km
y	coordinate, km

Note

Orignally from R. S. Crosson

Examples

gcllc(23, 35, 23.5, 35.6)

geoarea	<i>Area of Map objects</i>
---------	----------------------------

Description

vector of areas of polygons in map

Usage

geoarea(MAP, proj=NULL, ncut=10)

Arguments

MAP	Map structure
proj	projection
ncut	minimum number of points in polygon

Details

Uses sf function. If proj is NULL then the project is reset to UTM spherical for each element separately to calculate the area in km. ncut is used to eliminate area calculations with strokes less than the specified number.

Value

vector of areas

Note

areas smaller than a certain tolerance are NA

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

sf::st_area

geoLEGEND

Geological legend from GEMap Structure

Description

Create and add Geological legend from GEMap Structure

Usage

```
geoLEGEND(names, shades, zx, zy, nx, ny, side=1, cex=0.5)
```

Arguments

names	namesof units
shades	colorsof units
zx	width of box, mm
zy	height of box, mm
nx	number of boxes in x-direction
ny	number of boxes in y-direction
side	Side of the plot for the legend (1,2,3,4)
cex	Character expansion for text in legend

Details

Adds geological legend based on information provided. Legend is placed in margin.

Value

Graphical Side Effects

Note

If plot is resized, should re-run this as the units depend on the screen size information and the transformation of user coordinates.

GEOMap.breakline	<i>Break a line at specified indices into a list</i>
------------------	--

Description

Break a line at specified indices into a list

Usage

```
GEOMap.breakline(Z, ww)
```

Arguments

Z	list of x,y location values
ww	index vector of break locations

Value

newx	list x of strokes
newy	list y of strokes

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

Examples

```
Y=list()
Y$x=c(170,175,184,191,194,190,177,166,162,164)
Y$y=c(-54,-60,-60,-50,-26,8,34,37,10,-15)

GEOMap.breakline(Y, 5)
```

GEOmap.breakpoly	<i>Break up a polygon</i>
------------------	---------------------------

Description

Break up a polygon

Usage

```
GEOmap.breakpoly(Z, ww)
```

Arguments

Z	list, x,y locations
ww	vector of indecies where NAs occur

Details

The NA values in Z represent breaks. GEOmap.breakpoly breaks the polygon up into individual strokes. The beginning and the ending of the stroke are combined.

Value

newx	list of x values
newy	list of y values

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

See Also

fixCoastwrap, GEOmap.breakline

Examples

```
x=1:100
y = 1:100

ww = c(25, 53, 75)

A = list(x=x, y=y)

W = GEOmap.breakpoly(A , ww)
```

`GEOmap.cat`*Concatenate Two GEOmaps*

Description

Combine Two GEOmaps into one

Usage

```
GEOmap.cat(MAP1, MAP2)
```

Arguments

MAP1	GEOmap list
MAP2	GEOmap list

Details

Maps are combine consecutively.

Value

GEOmap	list
--------	------

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

See Also

`GEOmap.Extract`, `GEOmap.CombineStrokes`, `list.GEOmap`

Examples

```
data(coastmap)
CUBA = GEOmap.Extract(coastmap,90, INOUT="in" )

NSAMER = GEOmap.Extract(coastmap,2, INOUT="in" )
AMAP = GEOmap.cat(CUBA, NSAMER)
plotGEOmap(AMAP )
```

GEOmap.CombineStrokes *Combine strokes in a GEOmap list*

Description

Combine strokes in a GEOmap list

Usage

```
GEOmap.CombineStrokes(MAP, SEL)
```

Arguments

MAP	GEOmap list
SEL	index of strokes to be combined

Details

Strokes are combined in the order designated by the SEL index vector. The direction of the strokes is not modified - this may have to be fixed so that strokes align properly.

Value

GEOmap list	
STROKES	Metadata for strokes
POINTS	list, lat=vector, lon=vector

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

See Also

GEOmap.cat, GEOmap.Extract, GEOmap.CombineStrokes, list.GEOmap

Examples

```
data(coastmap)
SEL = which(coastmap$STROKES$nam=="Caribbean")

CAR = GEOmap.Extract(coastmap, SEL, INOUT="in" )

plotGEOmap(CAR, MAPstyle=3, NUMB=TRUE)

CAR2 = GEOmap.CombineStrokes(CAR, SEL =c(6:15) )

plotGEOmap(CAR2, MAPstyle=3, MAPcol='red' , add=TRUE)
```

GEOmap.Extract

Extract from GEOmap

Description

Extract or Exclude parts of a GEOmap list.

Usage

```
GEOmap.Extract(MAP, SEL, INOUT = "out")
fastExtract(MAP, SEL, INOUT = "out")
GEOmap.limit(MAP, LLLim )
```

Arguments

MAP	GEOmap List
SEL	Selection of stroke indices to include or exclude
INOUT	text, "in" means include, "out" means exclude
LLLim	vector latlon limits

Details

Can either extract from the GEOmap data list with in, or exclude with out. fastExtract is the same but may be faster since it does not process all the strokes in the base GEOmap.

Value

GEOmap	list
--------	------

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

See Also

GEOmap.cat, GEOmap.Extract, GEOmap.CombineStrokes, list.GEOmap, getGEOmap, plotGEOmap, SELGEOmap, boundGEOmap,

Examples

```
data(coastmap)
SEL=which(coastmap$STROKES$nam=="AMERICAS")
NSAMER = GEOmap.Extract(coastmap,SEL, INOUT="in" )
plotGEOmap(NSAMER)
```

GEOmap.list

*GEOmap to list***Description**

Inverse of list.GEOmap.

Usage

```
GEOmap.list(MAP, SEL = 1)
```

Arguments

MAP	GEOmap list
SEL	index, selection of specific strokes

Details

Returns the GEOmap strokes and instead of a long vector for the points they are broken down into a list of strokes.

Value

STROKES	Metadata for strokes
POINTS	list, lat=vector, lon=vector
LL	list of lat-lon strokes

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

See Also

GEOmap.cat, GEOmap.Extract, GEOmap.CombineStrokes, list.GEOmap

Examples

```
data(coastmap)
SEL=which(coastmap$STROKES$nam=='CUBA')
G = GEOmap.list(coastmap, SEL=SEL )

### Lat-Lon of Cuba
G$LL
```

GEOsymbols

GEOsymbols

Description

Plot a set of Geological Symbols

Usage

GEOsymbols()

Details

Currently the choices in symbols are:

contact anticline syncline OverTurned-ant OverTurned-syn perp thrust normal dextral sinistral
detachment bcars

Value

Graphical Side effect

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

See Also

bcars, thrust, teeth, SynAnticline, SSfault, horseshoe, strikeslip, OverTurned, normalfault, PointsAlong

Examples

GEOsymbols()

 GEOTOPO

Topographic Plot of geographic region

Description

Extract subset of a topographic database, interpolate and plot using the persp program.

Usage

```
GEOTOPO(TOPO, PLOC, PROJ, calcol=NULL, nx=500, ny=500, nb = 4, mb = 4, hb = 8, PLOT=TRUE)
```

Arguments

TOPO	list of x,y,z for a DEM
PLOC	Location list, includes vectors LON and Lat
PROJ	projection
calcol	color table for coloring elevations above sea level
nx	number of points in x grid, default=500
ny	number of points in y grid, default=500
nb	see function mba.surf, default = 4
mb	see function mba.surf, default = 4
hb	see function mba.surf , default= 8
PLOT	logical, TRUE=plot a map and return color map

Details

The return matrix PMAT is a rotation matrix used for adding geographic (projected) data onto the perspective plot.

ETOPO5 or ETOPO2 can be downloaded from and installed using these links: <http://leesj.sites.oasis.unc.edu/FETCH/GRAB/RPACKAGES/ETOP02.RData> and <http://leesj.sites.oasis.unc.edu/FETCH/GRAB/RPACKAGES/ETOP05.RData>

Value

PMAT	Matrix from persp, used for adding other geographic information
xo	x-coordinates
yo	y-coordinates
IZ	interpolated elevations
Cmat	matrix of RGB Colors
Dcol	dimensions of Cmat

Note

If PLOT is false the transform matrix PMAT and the color mapping matrix Cmat will be returned as NA. To create these for future plotting, use TOPOCOL or LandSeaCol functions. TOPOCOL simply assigns values above sea level with one color scale and those below with under water colors. LandSeaCol requires a coastal map and fills in land areas with terrain colors and sea areas with blue palette colors.

Author(s)

Jonathan M. Lees<jonathan.lees.edu>

See Also

subsetTOPO, TOPOCOL, LandSeaCol, settopocol, subsetTOPO, persp, DOTOPOMAPI

Examples

```
## Not run:

library(geomapdata)

#### need to download and install ETOPO data
### data(ETOP05)
load(ETOP05)
PLOC=list(LON=c(137.008, 141.000),LAT=c(34.000, 36.992),
          x=c(137.008, 141.000), y=c(34.000, 36.992) )

PROJ = setPROJ(type=2, LAT0=mean(PLOC$y) , LON0=mean(PLOC$x) )
COLS = settopocol()
JMAT = GEOTOPO(ETOP05, PLOC, PROJ, COLS$scalcol, nx=1000, ny=1000, nb=8, mb=8, hb=12, PLOT=TRUE)

##### this plot can be duplicated by using the output or GEOTOPO

PMAT = persp(JMAT$xo, JMAT$yo, JMAT$IZ$z, theta = 0, phi = 90, r=4000,
col=JMAT$Cmat[1:(JMAT$Dcol[1]-1), 1:(JMAT$Dcol[2]-1)] , scale = FALSE,
ltheta = 120, lphi=60, shade = 0.75, border = NA, expand=0.001, box = FALSE )

## End(Not run)
```

Description

Extract from ETOPO5 or ETOPO2 data a rectangular subset of the full data.

Usage

```
getETOPO(topo, glat = c(-90, 90), glon = c(0, 360))
```

Arguments

topo	A DEM matrix, ETOPO5 or ETOPO2
glat	2-vector, latitude limits
glon	2-vector, longitude limits (these are converted 0-360)

Details

ETOPO2 and ETOPO5 are stored in a strange way: the lons are okay the latitudes are upside down.

ETOPO5 or ETOPO2 can be downloaded from and installed using these links: <http://leesj.sites.oasis.unc.edu/FETCH/GRAB/RPACKAGES/ETOP02.RData> and <http://leesj.sites.oasis.unc.edu/FETCH/GRAB/RPACKAGES/ETOP05.RData>

Value

Returns a matrix with attributes in lat-lon that are correct for usage in image or other R imaging programs.

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

glon = c(235, 243)
b5 = getETOPO(ETOP05, glat, glon)
image(x=attr(b5, 'lon'), y=attr(b5,'lat'), z=b5, col=terrain.colors(100) )
contour( x=attr(b5, 'lon'), y=attr(b5,'lat'), z=b5, add=TRUE)

## End(Not run)
```

getGEOMap

Get Geomap

Description

Get Geomap from ascii files

Usage

```
getGEOMap(fn)
```

Arguments

fn	root name
----	-----------

Details

Files are stored as a pair: rootname.strks and rootname.pnts

Value

STROKES	List of stroke information:
nam	name of stroke
num	number of points
index	index where points start
col	color
style	plotting style: 1=point, 2=line,3=polygon
code	character, geological code
LAT1	bounding box lower left Lat
LAT2	bounding box upper right Lat
LON1	bounding box lower left Lon
LON2	bounding box upper right Lon
POINTS	List of point LL coordinates, list(lat, lon)
PROJ	optional projection parameters

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

See Also

plotGEOMapXY, boundGEOMap

Examples

```

## End(Not run)
```

getGEOperim

Get Lat-Lon Perimeter

Description

Get rectangular perimeter of region defined by set of Lat-Lon

Usage

```
getGEOperim(lon, lat, PROJ, N)
```

Arguments

lon	vector of lons
lat	vector of lats
PROJ	projection structure
N	number of points per side

Details

perimeter is used for antipolygon

Value

- List:
- x x-coordinates projected
 - y y-coordinates projected

Author(s)

Jonathan M. Lees<jonathan.lees.edu>

Examples

```
### target region
PLOC= list(LON=c(138.3152, 139.0214),
LAT=c(35.09047, 35.57324))

PLOC$x =PLOC$LON
PLOC$y =PLOC$LAT

#### set up projection
PROJ = setPROJ(type=2, LAT0=mean(PLOC$y) , LON0=mean(PLOC$x) )

perim= getGEOperim(PLOC$LON, PLOC$LAT, PROJ, 50)
```

getgreatarc	<i>Great Circle Arc</i>
-------------	-------------------------

Description

Get points along great circle between two locations

Usage

```
getgreatarc(lat1, lon1, lat2, lon2, num)
```

Arguments

- lat1 Latitude, point 1 (degrees)
- lon1 Longitude, point 1 (degrees)
- lat2 Latitude, point 2 (degrees)
- lon2 Longitude, point 2 (degrees)
- num number of points along arc

Value

lat	Latitude
lon	Longitude

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

See Also

getgreatarc, distaz

Examples

```
PARIS = c(48.8666666666667, 2.33333333333333)
RIODEJANEIRO = c(-22.9, -43.2333333333333)

g = getgreatarc(PARIS[1],PARIS[2], RIODEJANEIRO[1], RIODEJANEIRO[2],
100)
library(geomapdata)
data(worldmap)

plotGEOmap(worldmap, add=FALSE, shiftlon=180)

lines(g$lon+180, g$lat)
```

getmagsize

Earthquake Magnitude based on exponential

Description

Estimate a size for plotting earthquakes recorded as a logarithmic scale

Usage

```
getmagsize(mag, minsize = 1, slope = 1, minmag = 0, maxmag = 8, style = 1)
```

Arguments

mag	magnitudes from catalog
minsize	minimum size
slope	slope for linear scale
minmag	min magnitude
maxmag	max magnitude
style	Style of plotting: 0= all the same size; 1(default): exponential scale; 2=linear scale

Details

The idea is to have a scale reflect the size of the earthquake. The default style (1) has a few parameters left over from old program geotouch.

Value

vector of sizes for plotting

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

Examples

```
mag = 0:9

x = runif(10, 1, 100)
y = runif(10, 1, 100)

g = getmagsize(mag)

plot(c(0, 100), c(0, 100), asp=1, type='n')

points(x, y, pch=1, cex=g)
```

getnicetix

Nice Looking Lat-Lon pairs for plotting

Description

Given a set of lat lon pairs, return a new set of tic marks

Usage

```
getnicetix(lats, lons)
```

Arguments

lats	latitude range
lons	longitude range

Value

LAT	list output of niceLLtix
LON	list output of niceLLtix

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

See Also

niceLLtix

Examples

```
proj = setPROJ(7, LAT0 = 0 , LON0= -93)
rx = c(652713.4, 656017.4)
ry = c(1629271, 1631755)

gloc = XY.GLOB(rx, ry, proj)

G = getnicetix(gloc$lat, gloc$lon)

print(G)
```

getspline

Get a spline curve along a set of points

Description

Get a spline curve along a set of points

Usage

```
getspline(x, y, kdiv)
```

Arguments

x	x-coordinates
y	y-coordinates
kdiv	number of divisions in each sections

Value

LIST:

x	x-coordinates
y	y-coordinates

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

Examples

```
plot(c(-5,5), c(-5,5), asp=1, type='n' )
ff=list()
ff$x=c(-4.850,-4.700,-3.934,-2.528, 0.603, 2.647, 3.861, 2.626)
ff$y=c(-4.045,-2.087,-0.710, 0.172, 1.291, 2.087,-0.753,-4.131)

lines(ff, col='red')
G =getspline(ff$x, ff$y, kdiv=20)

lines(G, col='blue')
```

getsplineG

Get a spline curve along a set of points

Description

Get a spline curve along a set of points

Usage

```
getsplineG(x, y, kdiv)
```

Arguments

x	x-coordinates
y	y-coordinates
kdiv	number of divisions in each sections

Value

LIST:

x	x-coordinates
y	y-coordinates

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

Examples

```

plot(c(-5,5), c(-5,5), asp=1, type='n' )
ff=list()
ff$x=c(-4.850,-4.700,-3.934,-2.528, 0.603, 2.647, 3.861, 2.626)
ff$y=c(-4.045,-2.087,-0.710, 0.172, 1.291, 2.087,-0.753,-4.131)

lines(ff, col='red')
G =getsplineG(ff$x, ff$y, kdiv=20)

lines(G, col='blue')

```

GETXprofile

*Cross sectional profile through a digital elevation map***Description**

Example of how to use RPMG button functions. This example shows how to plot a DEM and interactively change the plot and find projected cross-sections through a surface.

Usage

```
GETXprofile(jx, jy, jz, LAB = "A", myloc = NULL, PLOT = FALSE, NEWDEV=TRUE, asp=1)
```

Arguments

jx, jy	locations of grid lines at which the values in 'jz' are measured.
jz	a matrix containing the values to be plotted
LAB	Alphanumeric (A-Z) for labeling a cross section
myloc	Out put of Locator function
PLOT	logical. Plot is created if TRUE
NEWDEV	logical. Plot is on a new device if TRUE
asp	aspect ration for plotting, see par

Details

The program uses a similar input format as image or contour, with structure from the locator() function of x and y coordinates that determine where the cross section is to be extracted.

Value

Returns a list of x,z values representing the projected values along the cross section.

RX	distance along cross section
RZ	values extracted from the elevation map

Note

The program is an auxiliary program provided to illustrate the RPMG interactive R analysis.

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

locator, image

Examples

```
## Not run:
##### get data
data(volcano)
#### extract dimensions of image
nx = dim(volcano)[1]
ny = dim(volcano)[2]

### establish units of image
jx = 10*seq(from=0, to=nx-1)
jy = 10*seq(from=0, to=ny-1)

#### set a letter for the cross section
LAB = LETTERS[1]

### coordinates of cross section on image
### this is normally set by using the locator() function
x1 = 76.47351
y1 = 231.89055
x2 = 739.99746
y2 = 464.08185

## extract and plot cross section

GETXprofile(jx, jy, volcano, myloc=list(x=c(x1, x2), y=c(y1, y2)), LAB=LAB, PLOT=TRUE)

## End(Not run)
```

GLOB.XY

Convert from GLOBAL LAT-LON to X-Y

Description

Convert from GLOBAL LAT-LON to X-Y

Usage

GLOB.XY(LAT, LON, PROJ.DATA)

Arguments

LAT	Latitude
LON	Longitude
PROJ.DATA	Projection list

Details

Units should be given according to the projection. This is the inverse of XY.GLOB.

Value

x	X in whatever units
y	Y in whatever units

Author(s)

Jonathan M. Lees<jonathan.lees.edu>

References

Snyder, John P., Map Projections- a working manual, USGS, Professional Paper, 1987.

See Also

XY.GLOB

Examples

```
proj = setPROJ(type = 2, LAT0 =23, LON0 = 35)

### get lat-lon
LL = XY.GLOB(200, 300, proj)

## find x-y again, should be the same
XY = GLOB.XY(LL$lat, LL$lon, proj)
XY
```

GLOBE.ORTH

Plot globe with orthogonal

Description

Plot globe with orthogonal

Usage

```
GLOBE.ORTH(lam0, phi1, R = 1, plotmap = TRUE, plotline=TRUE, add=FALSE,
  map = coastmap, mapcol = grey(0.2), linecol = grey(0.7), fill=FALSE)
```

Arguments

lam0	view origin longitude, degrees
phi1	view origin latitude, degrees
R	Radius of sphere, default=1
plotmap	logical, default=TRUE, add map
plotline	logical, default=TRUE, add grid of lat-lons
add	logical, default=FALSE, Do not start a new plot, rather add to existing plot
map	GEOmap list
mapcol	color for map
linecol	color for meridians and parallels
fill	fill polygons with color, default=FALSE

Details

Plots whole globe with grid.

Value

Graphical Side effects

GlobeView	<i>Global Plot</i>
-----------	--------------------

Description

Plot global view of the earth

Usage

```
GlobeView(phicen, lamcen, worldmap, MAXR, SEL = 1,
circol = rgb(1, 0.8, 0.8), innercol = "white", linecol = rgb(0, 0, 0),
mapcol = rgb(0, 0, 0), backcol = "white", add=FALSE, antip=TRUE)
```

Arguments

phicen	Latitude
lamcen	Longitude
worldmap	Map List
MAXR	Maximum radius (degrees)
SEL	Selection index from map
circol	color for concentric circles
innercol	inner color
linecol	line color, NA=do not plot
mapcol	map fill color, NA=do not fill polygon
backcol	background color
add	logical, FALSE means start a new plot
antip	logical, default=TRUE means white out area outside of polygon

Details

Creates a plot of view of the globe from a point in space using an Equal-Area projection. Uses the lamaz.eqarea routine for projection. (Lambert-Azimuthal Equal Area). Using NA for linecol or mapcol means do not plot lines or fill polygons respectively.

Value

Perimeter x,y points around the perimeter of the plot

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

See Also

plotGEOmap, lamaz.eqarea

Examples

```
data(coastmap)

```

gmat

Globe Rotation Matrix

Description

Globe Rotation Matrix

Usage

```
gmat(vec, p, alpha)
```

Arguments

vec	vector axis to rotate about
p	translation point (c(0,0,0))
alpha	angle to rotate, degrees

Details

Given an arbitrary axis, return matrix for rotation about the axis by alpha degrees.

Value

4 by 4 Matrix for translation and rotation

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

References

Rogers and Adams

Examples

```
##### kamchatka

kamlat = c(48.5, 65)
kamlon = c(150, 171)

KAMLAT0=mean(kamlat)
KAMLON0=mean(kamlon)

##### korea

KORlon = c(123,133)
KORlat = c(33,44)

KORLON0=mean(KORlon)
KORLAT0=mean(KORlat)

# convert to cartesian
v1 = ll2xyz(KORLAT0, KORLON0 )
v2 = ll2xyz(KAMLAT0, KAMLON0)

### get cross product
g = X.prod((v1), (v2))

### use dot product to get angle
delta = (180/pi)*acos( sum(v1*v2)/(sqrt(sum(v1^2))*sqrt(sum(v2^2))))
```

```
### get rotation matrix  
R1 = gmat(g, c(0,0,0) , -delta)
```

goodticdivs

Nice tic division

Description

Determine a reasonable tick division for lat-lon tic marks.

Usage

```
goodticdivs(ddeg)
```

Arguments

ddeg degree difference

Details

Designed to give approximately 4-6 divisions for plotting given the range input.

Value

K suggested divisor

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

See Also

niceLLtix

Examples

```
goodticdivs(20)  
goodticdivs(100)
```

horseshoe

*Horseshoe Symbol***Description**

Draw a Horseshoe Symbol

Usage

```
horseshoe(x, y, r1 = 1, r2 = 1.2, h1 = 0.5, h2 = 0.5, rot = list(cs = 1,
sn = 0), col = "black", lwd = lwd, fill=FALSE)
```

Arguments

x	x-coordinates
y	y-coordinates
r1	x-radius of curled part
r2	y-radius of curled part
h1	length of first leg
h2	length of 2nd leg
rot	rotation, cos, sine
col	color of teeth and line
lwd	line width
fill	logical, TRUE=fill

Value

Grapical Side Effect

```

inpoly

Test set of points for inside/outside polygon

Description

takes a set of points and tests with function inside()

Usage

```
inpoly(x, y, POK)
```

Arguments

x	x coordinates
y	y coordinates
POK	polygon structure list x,y

Value

Returns vector of 0,1 for points inside polygon

Author(s)

Jonathan M. Lees <jonathan.lees@unc.edu>

See Also

```

insertNA

Insert NA in a vector

Description

Inserting NA values in a vector at specific index locations

Usage

```
insertNA(y, ind)
```

Arguments

y	vector
ind	index locations where NA is inserted

Details

The vector is parsed out and NA values are inserted where after the index values provided.

Value

v new vector with NA's

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

Examples

```
x = 1:10
insertNA(x, 6)
```

insertvec	<i>Insert a set of values in a vector</i>
-----------	---

Description

Inserting values in a vector at specific index locations

Usage

```
insertvec(v, ind, val)
```

Arguments

v	vector
ind	index locations where val is inserted
val	some vector of insertion, maybe NA

Details

The vector is parsed out and val values are inserted where after the index values provided.

Value

v new vector with val inserted after the index

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

Examples

```
x = 1:20

insertvec(x, c(4,17) , NA)
```

inside

*Determine if point is inside polygon***Description**

Given a polygon and a point, determine if point is internal to polygon. The code counts the number of intersection the point and a dummy point with a very large x-value makes with the polygon.

Usage

```
inside(A, POK)
```

Arguments

A	Point, list with x, y
POK	list of x,y values of polygon

Value

Returns integer, 0=no intersection, 1=intersection

Author(s)

Jonathan M. Lees <jonathan.lees@unc.edu>

See Also

Lintersect, ccw, inpoly

Examples

```
#### make a polygon:

```

insideGEOMapXY	<i>Get LAT-LON points that fall inside a map</i>
----------------	--

Description

Get LAT-LON points that fall inside a map

Usage

```
insideGEOMapXY(lat, lon, PROJ = NULL, R = NULL, PMAT = NULL)
```

Arguments

lat	vector of latitudes
lon	vector of longitudes
PROJ	projection structure
PMAT	persp matrix for perspective plot
R	List(lat, lon, radius) for selecting instead of using usr coordinates

Details

The parameters par("usr") is queried and used to select the lat and lons that fall within the mapped region. If the list R=list(lat, lon, radius) is provided, then all indices of points falling within that radius are returned.

Value

Vector of index values for points that satisfy geographic criteria

Author(s)

Jonathan M. Lees<jonathan.lees.edu>

Examples

```
## Not run:

data('japmap', package='geomapdata' )
isel1 = which( japmap$STROKES$code != "i" & japmap$STROKES$num>120 )

PROJfuji = setPROJ(type = 2, LAT0=35.358,LON0=138.731)
plotGEOMapXY(japmap, PROJ=PROJfuji, SEL=isel1 , add=FALSE)

cex=.5)
wv =insideGEOMapXY(gvol$lat, gvol$lon, PROJfuji)
cbind(gvol$name[wv], gvol$lat[wv], gvol$lon[wv])

## End(Not run)
```

jarea

Area of closed polygon.

Description

Returns area of polygon.

Usage

```
jarea(L)
```

Arguments

L list with x,y components

Details

If polygon is counter clockwise (CCW) area will be positive, else negative. If not sure, take absolute value of output.

Value

Area in dimensions of x,y

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

Examples

```

set.seed(12)
X = runif(10, 1, 100)
Y = runif(10, 1, 100)

hc = chull(X, Y)
#### looks like chull returns points in clockwise
L = list(x=X[hc] , y=Y[hc] )

j1 = jarea(L )

##### reverse order of polygon
jc = rev(hc)
L = list(x=X[jc] , y=Y[jc] )
j2 = jarea(L )

```

KINOUT

Map inside-outside

Description

Determine if strokes are in a target region

Usage

```
KINOUT(MAP, LLlim, projtype = 2)
```

Arguments

MAP	GEOmap list
LLlim	list: lat lon limits
projtype	local projection type

Details

The limits are used to calculate an origin and each point is projected accordingly. The x-y values are evaluated for being in or out of the target. A local projection is used - UTM (2) is the preferred projection.

Value

Vector or indeces of strokes that intersect the target.

Note

The mercator projections do not work well with this routine.

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

print( coastmap$STROKES$nam[k] )

testmap = GEOMap.Extract(coastmap,k, INOUT="in" )

plotGEOMap(testmap)
```

lamaz.eqarea

Lambert-Azimuthal Equal Area

Description

Map Projection (Lambert-Azimuthal Equal Area) for global plots.

Usage

```
lamaz.eqarea(phi1, lam0, phi, lam, R=6371)
lamaz.inverse(phi1, lam0, x, y, R=6371 )
```

Arguments

phi1	Central Latitude, radians
lam0	Central Longitude
phi	vector of Latitude, points for plotting, radians
lam	vector of Longitude, points for plotting , radians
R	radius of sphere
x	position on the plot
y	position on the plot

Value

x	position on the plot
y	position on the plot

Note

This is a projection routine that does not need to be set in advance. lamaz.inverse is the inverse of lamaz.eqarea.

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

LandSeaCol	<i>Land and Sea Colors</i>
------------	----------------------------

Description

Color pixels with two palettes, one for land the other for sea.

Usage

```
LandSeaCol(IZ, coastmap, PROJ, calcol = NULL)
```

Arguments

IZ	list of x, y, z suitable for plotting with image or contour.
coastmap	coastal map from GEOMap
PROJ	projection list
calcol	color map for the land

Details

The program uses closed polygons in the map list to separate the pixels into land versus sea. Sea is colored with a palette of blues, land is colored according to topographic color scheme extracted from palettes similar to GMT palettes.

All map and pixel coordinates are projected with the same projection parameters. calculations are done in XY coordinates.

ETOPO5 or ETOPO2 can be downloaded from and installed using these links: <http://leesj.sites.oasis.unc.edu/FETCH/GRAB/RPACKAGES/ETOPO2.RData> and <http://leesj.sites.oasis.unc.edu/FETCH/GRAB/RPACKAGES/ETOPO5.RData>

Value

Cmat	Matrix of colors for each pixel
UZ	Under water
AZ	Above Sea Level

list.GEOMap	<i>List stroke points in a GEOMap</i>
-------------	---------------------------------------

Description

List stroke points in a GEOMap

Usage

```
list.GEOMap(MAP, SEL = 1)
```

Arguments

MAP	GEOMap list, with LL list
SEL	index, selection of specific strokes

Details

Returns a GEOMap list from the output of GEOMap.list . This is used to repack a GEOMap list. Tis function can be used to create a new geomap if you have only strokes. See example. Can be used to convert a gmt map file (in ascii text format) to GEOMap.

Value

GEOMap list	
STROKES	Metadata for strokes
POINTS	list, lat=vector, lon=vector

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

lll2xyz	<i>List Lat-Lon to cartesian XYZ</i>
---------	--------------------------------------

Description

List Lat-Lon to cartesian XYZ

Usage

```
lll2xyz(lat, lon)
```

Arguments

lat	latitude
lon	longitude

Value

```
list(x,y,z)
```

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

See Also

ll2xyz, Lxyz2ll, xyz2ll

Examples

```
lll2xyz(23, 157)
```

LLLlabel	<i>Nice Lat-Lon Label</i>
----------	---------------------------

Description

Create a text string for Lat-Lons

Usage

```
LLLlabel(DD, dir = 1, ksec = -1)
```

Arguments

DD	Decimal degrees
dir	direction, NS or EW
ksec	number of decimals for seconds

Details

creates text labels with minutes and seconds if needed.

Value

character string

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

See Also

niceLLtix

Examples

```
DD = -13.12345
k = LLlabel(DD)
```

LLsmallcircMap	<i>World Map centered on Lat-Lon</i>
----------------	--------------------------------------

Description

World Map centered on Lat-Lon with Lambert-Azimuthal projection.

Usage

```
LLsmallcircMap(phicen, lamcen, worldmap, eqlat, eqlon, MAXR = 100,
  circol = rgb(1, 0.8, 0.8), mapcol = rgb(0, 0, 0), eqcol = rgb(0.8, 0.8,
  1) , pch=25, ecex=1 )
```

Arguments

phicen	Center Latitude
lamcen	Center Longitude
worldmap	GEOmap map structure
eqlat	Latitudes of points, vector
eqlon	Longitude of points, vector
MAXR	Maximum radius, degrees
circol	Color for small circles
mapcol	Color for map
eqcol	Color for points, single or 2-vector
pch	Plotting character for points
ecex	Plotting size for points

Details

Uses a Lamber-Azimuthal projection of the whole globe out to the given radius. If a vector of 2 colors are provided for the eqcol parameter, and the pch is one of (21:25), then a 2-tone points is plotted with ecol[1] on the perimeter, and ecol[2] on the interior.

Value

Graphical side effects

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

```

LOCPOLIMAP	<i>LOCPOLIMAP</i>
------------	-------------------

Description

This program takes a point and return the continent index for database manipulation.

Usage

```
LOCPOLIMAP(P, MAP)
```

Arguments

- P Point selected on screen using locator
- MAP List of maps and coordinates from database

Details

Uses the CIA data base definitions.

Value

- J Index to map data base

Author(s)

Jonathan M. Lees<jonathan.lees.edu>

See Also

SETPOLIMAP

Examples

```
P = list(lat=36.09063, lon=19.44610)

LMAP = SETPOLIMAP()

J
```

locworld	<i>Locate points in worlmap</i>
----------	---------------------------------

Description

Locate points in worlmap

Usage

```
locworld(shiftlon = 0, col = "brown", n = 2)
```

Arguments

shiftlon	rotate map by degrees
col	color of points
n	number of points

Value

lon	longitudes
lat	latitudes
LON	longitudes
LAT	latitudes
utmbox	UTM box list(lat, lon)
x	UTM x-coordinates
y	UTM y-coordinates
UTM0	utm origin for projection list(phi, lam)
shiftlon	rotate map by degrees

Author(s)

Jonathan M. Lees<jonathan.lees.edu>

## End(Not run)
```

Lxyz2ll*Cartesian to Lat-Lon*

Description

Cartesian vector to Lat-Lon List

Usage

```
Lxyz2ll(X)
```

Arguments

X list, x,y,z

Value

list of lat and lon

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

See Also

xyz2ll

Examples

```
L112xyz(23, 157)
```

MAPconstants

Set Various Map Constants

Description

Used for retrieval when doing projections

Usage

MAPconstants()

Details

These include a sime list of: DEG2RAD, RAD2DEG, A.MAPK, E2.MAPK, E2.GRS80, E.MAPK, E1.MAPK, TwoE.MAPK, R.MAPK, FEET2M, M2FEET

Value

List of constants for Projections

Author(s)

Jonathan M. Lees<jonathan.lees.edu>

References

Snyder, John P., Map Projections- a working manual, USGS, Professional Paper, 1987.

See Also

XY.GLOB, projtype, utm.sphr.xy

Examples

MAPconstants()

maplim	<i>Map Limits</i>
--------	-------------------

Description

Set reasonable map limits from a set of Lat-Lon pairs.

Usage

```
maplim(lat, lon, pct = 0.1)
```

Arguments

lat	vector of latitudes
lon	vector of longitudes
pct	percent fraction to increase (or decrease) limits

Details

In some (GEOmap) programs the longitude needs to be modulus 360, so these are provided also.

Value

list of range of lats and lons

lat	lat limits
lon	lat limits
LON	lon limits modulus 360
lim	vector: lon1 lat1 lon2 lat2
LIM	vector: lon1 lat1 lon2 lat2, with lon limits modulus 360

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

See Also

`expandbound`, `plotGEOmapXY`

Examples

```

lat = rnorm(10, m=46, sd=2)
lon = rnorm(10, m=-121, sd=1)

M = maplim(lat, lon, pct=.2)

plot(M$lon, M$lat, type='n')
points(lon, lat)

##### plotting with a GEOmap
library(geomapdata)
data(worldmap)

PROJ = setPROJ(type=2, LON0=mean(lon), LAT0=mean(lat))

plotGEOmapXY(worldmap, LIM=M$LIM)
pointsGEOmapXY(lat, lon, PROJ =PROJ, pch=6)

```

maps2GEOmap

Convert maps data to GEOmap format

Description

Convert maps data to GEOmap format

Usage

```
maps2GEOmap(zz, wx = 1, mapnam = "temp")
```

Arguments

zz	Output list from maps package
wx	vector of breaks (in maps these are NA)
mapnam	Name pasted on each stroke

Details

The program takes the output of maps and converts to a GEOmap structure. This code should work with GMT style map files too.

Value

GEOmap list.

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

Examples

```
library(maps)

zz = map('state', region = c('new york', 'new jersey', 'penn'))

neweng = maps2GEOmap(zz)

plotGEOmap(neweng)
## L1 = locator(1)
L1=list()
L1$x=c(283.671347071854)
L1$y=c(42.008587074537)

LIMS1 = list( lon=range(neweng$POINTS$lon),
               lat=range(neweng$POINTS$lat) )

LIMS = c(LIMS1$lon[1], LIMS1$lat[1], LIMS1$lon[2], LIMS1$lat[2])

##### prepare maps 2:

z2 = map('world', region = c('iceland'))
ice = maps2GEOmap(z2)
plotGEOmap(ice)

## L2 = locator(1)
L2=list()
L2$x=c(341.146812632372)
L2$y=c(64.9180246121089)

##### this version here is nicer, but required WORLMAP2
###kice = grep('ice' , coast2$STROKES$nam, ignore.case =TRUE)

### ice = GEOmap.Extract(coast2, kice , "in")

MAP = rotateGEOmap(ice, L1$y , L1$x , L2$y , L2$x, beta=-90 )

proj = setPROJ( 2, LAT0=L1$y, LON0=L1$x )

plotGEOmapXY(neweng, LIM=LIMS, PROJ =proj, axes=FALSE, xlab="", ylab="" )

plotGEOmapXY(MAP, LIM=LIMS, PROJ =proj, axes=FALSE, xlab="",
              ylab="", add = TRUE, MAPcol = grey(.85) , lwd=2, xpd=TRUE)
```

```
plotGEOMapXY(neweng, LIM=LIMS, PROJ =proj, axes=FALSE,
              xlab="", ylab="", add=TRUE )
```

mapTeleSeis

World Map with Teleseismic Ray-paths

Description

World Map with Teleseismic Ray-paths

Usage

```
mapTeleSeis(sta, mylist, worldmap=NULL)
```

Arguments

sta	list of station locations
mylist	list of event locations
worldmap	worldmap data (e.g. from geomapdata)

Details

Uses GEOMap. No projection is used.

Value

Graphical side effects

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

Examples

```

Markup

Add markup information to an existing plot

Description

For use in GEOmap to add labels to a geographic plot

Usage

```
Markup(MM = list(), sel = 1, cex = 1, ...)
```

Arguments

MM	list of markup information
sel	vector, select which marks to be plotted
cex	character expansion
...	graphical parameters for par

Details

Uses the locator function

Value

Graphical Side Effects

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

## End(Not run)
```

merid

Orthogonal Projection of Meridian or Parallel

Description

Orthogonal Projection Meridian or Parallel

Usage

```
merid(lon, lat1=-90, lat2=90, lam0=0, phi1=41, R=1, by=1)
paral(lat, lon1=-180, lon2=180, lam0=0, phi1=41, R=1, by=1)
```

Arguments

lon	merid starting Longitude, degrees
lat	paral starting Latitude, degrees
lam0	origin Longitude, degrees
phi1	origin Latitude, degrees
R	Radius
by	increment in degrees
lat1	merid starting Latitude, degrees
lat2	merid ending Latitude, degrees
lon1	paral starting Longitude, degrees
lon2	paral ending Longitude, degrees

Details

Retruns points along a meridian running through lat, lon with a projection based on lam0 phi.

Value

list of x-y values for plotting

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

NoOverlap

Shift Symbols

Description

Shift Symbols such that there is no overlap

Usage

```
NoOverlap(x, y, focsiz, SEL = 0, OLDx = 0, OLDy = 0, cenx = 0, ceny = 0)
```

Arguments

x	x-location
y	y-location
focsiz	symbol size
SEL	selection of which symbols to shift
OLDx	x-locations of origin
OLDy	y-locations of origin
cenx	center x
ceny	center y

Details

Program is used for finding positions for exploding. A vector is dcalculated from each origin to each point and explosions are projected along these directions until a position is found that does not overlap. The position is nudged by a value of focsiz at each step. If OLDx and OLDy are not provided, cenx and ceny are used as origin points.

Value

x,y list of new positions

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

```

NSarrow

North-South Weather Vane Arrow

Description

Add north-south weather vane arrow figure

Usage

```
NSarrow(x = NULL, y = NULL, R = 1, col.arrow = 1, col.N = 1,
col.circ = 1, rot = 0, PMAT = NULL)
```

Arguments

x	X-location vector, if list, include both x and y values
y	Y-location vector, not needed if x is a list
R	radius, in plot coordinates
col.arrow	color for arrow, default="black"
col.N	color for N symbol
col.circ	color for circle
rot	rotation angle, degrees
PMAT	projection matrix, output of persp

Details

The location list should have 2 values for x and y each, the second value for y determines the radius R if it is not provided. The first element of y is the center of the weather vane. If no x-list is provided, the interactive locator function is invoked and a list is returned for future work.

Value

x	x-location
y	y-location

NSarrow(list(x=x, y=y), rot=25)

```

NSWath

Cross sectional Swaths of Earthquakes over Japan

Description

Set of 4 swaths for cross section across Japan

Usage

```
data(NSWath)
```

Format

list of cross sections each consists of a list of form:

r r-distance along cross section (x-coordinate)

dh distance from cross section

depth depth in cross section (y-coordinate)

flag index vector of which earthquakes fell in swath and depth range

InvBox coordinates of swath for plotting on map

Source

Data is extracted from an earthquake data base of relocated events provided by Robert Engdahl.

References

Engdahl, E. R., R. D. van der Hilst, S. H. Kirby, G. Ekstrom, K. M. Shedlock, and A. F. Sheehan (1998), A global survey of slab structures and internal processes using a combined data base of high-resolution earthquake hypocenters, tomographic images and focal mechanism data, *Seismol. Res. Lett.*, 69, 153-154.

Examples

```
## Not run:
data(NSWath)
for(i in 1:length(NSWath))
{
  dev.new()
  LAB = attr(NSWath[[i]], "LAB")

  XSECwin( NSWath[[i]] , iseclab=i, xLAB=LAB , labs=NULL, demo=TRUE )
}

## End(Not run)
```

ortho.proj

Orthogonal Map Projection

Description

Orthogonal Map Projection

Usage

```
ortho.proj(lat, lon, lon0, lat1, R)
```

Arguments

lat	latitude, degrees
lon	longitude, degrees
lon0	view origin longitude, degrees
lat1	view origin latitude, degrees
R	Radius of sphere, default=1

Details

Assumes spherical globe. This function is not part of the normal GEOMap plotting routines.

Value

list

x x, coordinate in units of R

y y, coordinate in units of R

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

References

Snyder, John P., Map Projections- a working manual, USGS, Professional Paper, 1987.

Examples

```
olat = 0
      olon = 0

      tlat = 23
      tlon = 30
R = 1
ortho.proj(tlat, tlon, olon, olat, R)
```

OverTurned	<i>Plot Overturned fault</i>
------------	------------------------------

Description

Plot Overturned fault

Usage

```
OverTurned(x, y, syn = TRUE, spacing = NULL, N = 1, r1 = 1, r2 = 1.2,
  h1 = 0.5, h2 = 0.5, endtol = 0.1, REV = FALSE, col = "black", ...)
```

Arguments

x	x-coordinates
y	y-coordinates
syn	logical, TRUE=syncline, FALSE=anticline
spacing	spacing of points
N	number of points
r1	x-radius of curled part
r2	y-radius of curled part
h1	length of first leg
h2	length of 2nd leg
endtol	indent on either ends
REV	reverse direction of x-y
col	color of teeth and line
...	graphical parameters

Value

Graphical Side effect

OverTurned(ff$x,ff$y, r1= .4, r2= .8, h1= .5, h2= .5, N=5, syn=FALSE,
endtol=.2)
```

perpen	<i>perpendicular marks along line</i>
--------	---------------------------------------

Description

draw perpendicular marks along line

Usage

```
perpen(x, y, h, rot, col = "black", lwd = 1)
```

Arguments

x	x-coordinates
y	y coordinates
h	height of tooth
rot	rotation of teeth
col	color of line
lwd	line width

Details

Used by faultperp

Value

pgon

Plot regular polygon: pentagon, hexagon, octagon

Description

Plot regular polygon: pentagon, hexagon, octagon

Usage

```
pgon(x, y, siz=siz, col="black", border=NULL, K=5, startalph = -45, ... )
```

Arguments

x	x-coordinate
y	y-coordinate
siz	radius or size
col	inside color
border	border color
K	number of sides per polygon
startalph	starting angle
...	graphical parameters

Details

I figure is resized needs to be re-called.

Value

y = rnorm(N)

z = rnorm(N)

##### draw pentagons
plot(x,y, type='n', axes=FALSE, ann=FALSE)
pgon(x,y, siz=abs(z)/10, col="white", border='black', startalph =60, K=5, lwd=.5, xpd=TRUE)

##### color the points, use 4-sided blocks
rbow=rainbow(100)

ss = sample(1:100, N, replace = TRUE, prob = NULL)
plot(x,y, type='n', axes=FALSE, ann=FALSE)
pgon(x,y, siz=abs(z)/10, col=rbow[ss], border='black', startalph =60, K=4, lwd=.5, xpd=TRUE)

```

pline

*Point to line distance***Description**

get sortest distance from arbitrary point to a segment.

Usage

```
pline(x1, y1, x2, y2, ex, ey)
```

Arguments

x1	x coordinate segment start
y1	y coordinate segment start
x2	x coordinate segment end
y2	y coordinate segment end
ex	x, point
ey	y point

Value

vector of:

dis	distance to segment
dee	distance to line
zee	projection along line
px	x, point of intersection
py	y, point of intersection

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

```

plotGEOMap

Plot a GEO map

Description

High Level plot of GEO map

Usage

```
plotGEOMap(MAP, LIM = c(-180, -90, 180, 90) ,
  shiftlon = 0, add = TRUE ,
  NUMB = FALSE , SEL = NULL, MAPcol = NULL,
  MAPstyle = NULL, border=NA,
  PLOT = TRUE, PRINT=FALSE, BB = FALSE, ...)
```

Arguments

MAP	Map Structure
LIM	Lat-Lon limits
add	logical, TRUE= add to existing plot
SEL	Index vector of strokes to be used in plotting, default=NULL(use all that pass other tests)
MAPcol	override color for maps
MAPstyle	override plotting style for maps
border	color, add border to polygons, NA=no border
shiftlon	degrees, rotate longitude
NUMB	logical, number the strokes on the map
PLOT	logical, TRUE=plot map, else just set up plotting area
PRINT	logical, TRUE=show selected stroke indices on the screen(default=FALSE)
BB	logical, TRUE=add bounding box to each stroke (default=FALSE)
...	graphical parameters

Details

plotGEOMap does not plot a projected map. MAPcol and MAPstyle can be used to override the colors and style in the map-list. These are applied to all the strokes.

Value

Graphical Side Effects

## End(Not run)
```

plotGE0mapXY

Plot a projected GEO map

Description

High Level plot of GEO map

Usage

```
plotGEOMapXY(MAP, LIM = c(-180, -90, 180, 90),
  PROJ = list(), PMAT=NULL,
  add = TRUE, SEL=NULL, GRID = NULL, GRIDcol = 1,
  MAPcol = NULL, MAPstyle = NULL, border = NA,
  cenlon = 0, shiftlon = 0, linelty = 1,
  linelwd = 1, ptpch=".", ptcex=1, NUMB = FALSE, ...)
```

Arguments

MAP	Map Structure
LIM	Lat-Lon limits
PROJ	Projection list
PMAT	Perspective matrix conversion
add	logical, TRUE= add to existing plot
SEL	Index vector of strokes to be used in plotting, default=NULL(use all that pass other tests)
GRID	logical, TRUE=add grid lines
GRIDcol	color for grid lines
MAPcol	override color for maps
MAPstyle	override plotting style for maps
border	color, add border to polygons, NA=no border
cenlon	center longitude of plot
shiftlon	degrees, rotate longitude
linelty	Line type
linelwd	line width
ptpch	plotting character for strokes (style=1) that are plotted as points
ptcex	character expansion factor for style=1 strokes
NUMB	logical, number the strokes on the map
...	graphical parameters

Details

plotGEOMapXY includes projection of the data, plotGEOMap does not. MAPcol and MAPstyle can be used to override the colors and style in the map-list. These are applied to all the strokes.

For strokes that are of style=1 points are plotted with graphical parameters ptpch="." and ptcex=1 unless otherwise indicated.

plothypos

Plot Edicenters

Description

Plot hypocenter color coded to depth and size scaled by magnitude.

Usage

```
plothypos(lat, lon, z, proj, mag = NULL, cex = 0.4, pch =21, PMAT = NULL, alpha = NULL)
```

Arguments

lat	Latitude
lon	Longitude
z	km Depth, (positive down)
proj	Projection structure
mag	Magnitude
cex	character expansion
pch	plotting character, default=21
PMAT	transformation matrix
alpha	transparency factor

Details

Adds hypocenters to an existing plot.

Value

Graphical Side effects.

Note

The events are color coded according to depth.
Only a few devices can handle transparency effects.

plotworldmap

Plot World Map with UTM sections

Description

Plot World Map with UTM sections

Usage

```

plotworldmap(MAP, LIM = c(-180, -90, 180, 90), shiftlon = 0,
add = TRUE, NUMB = FALSE, PLOTALL=TRUE, Decorate=FALSE , ...)

```

Arguments

MAP	GEOmap structure
LIM	Vector of limits c(lon1, lat1, lon2, lat2)
shiftlon	Rotate map by degrees longitude (must adjust the LIM vector accordingly, see example below)
add	logical, TRUE=add to current plot
NUMB	logical, add numbers to plot
PLOTALL	logical, plot all strokes, do not select

Decorate	logical, add UTM regional designations
...	graphical parameters from par

Value

```

PointsAlong

Find spaced Points along a line

Description

find evenly spaced points along a line

Usage

```
PointsAlong(x, y, spacing = NULL, N = 1, endtol = 0.1)
```

Arguments

x	x-coordinates
y	y-coordinates
spacing	spacing of points
N	number of points
endtol	indent on either ends

Details

The total length is returned: this is the line integral along the trace.

Value

List:

x	x-coordinates
y	y-coordinates
rot	angle at the points
TOT	total length along the trace

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu

Examples

```

plot(c(-5,5), c(-5,5), asp=1, type='n' )
ff=list()
ff$x=c(-4.850,-4.700,-3.934,-2.528, 0.603, 2.647, 3.861, 2.626)
ff$y=c(-4.045,-2.087,-0.710, 0.172, 1.291, 2.087,-0.753,-4.131)

g = PointsAlong(ff$x, ff$y, N=20)

lines(ff$x, ff$y)
points(g$x, g$y)

```

polyintern	<i>Internal point of polygon</i>
------------	----------------------------------

Description

Find a central internal point of a polygon

Usage

```
polyintern(P, n = 10, PLOT=FALSE)
```

Arguments

P	Polygon,xy
n	grid dimension over polygon, n by n
PLOT	logical, TRUE=plot

Details

A grid is laid over the polygo, the internal points are extracted and for each one the shortest distance to te perimeter is determined. Then the point with the largest distance is returned.

Value

x	x coordinate of point
y	y coordinate of point
zi	index of point
nx	internal grid points x
ny	internal grid points y
ef	internal grid points distances to perimeter

rectPERIM	<i>Extract a rectangular perimeter</i>
-----------	--

Description

Extract a rectangular perimeter

Usage

```
rectPERIM(x, y = 1, pct = 0)
```

Arguments

x	x values or a list include x, y members
y	y values, if missing, x must be a list
pct	Percent expansion, based on range of x and y values. If pct>1 it is divided by 100 to get a fractional percent expansion.

Details

The rectangular box will be expanded based on the percent pct.

Value

list of x, y values from lower left corner counter clockwise around perimeter

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

polygon(rp)
text(rp, labels=1:4, pos=c(1,1,3,3), font=2, cex=2)

fx2 = rnorm(20, m=-1)
fy2 = rnorm(20, m=-1)

Fx = list(x=fx2, y=fy2)

points(Fx$x, Fx$y, col='red')

rp = rectPERIM(Fx)

polygon(rp, border='red')

##### try expanding the perim:

plot(fx, fy, xlim=c(-4, 4), ylim=c(-4,4), asp=1)
rp = rectPERIM(fx, fy, pct=0.1)

polygon(rp)

rp = rectPERIM(fx, fy, pct=0.2)

polygon(rp)
```

rekt2line*Rectangle Line Overlap*

Description

Find points on a rectangle closest to a set of points.

Usage

```
rekt2line(rekt, pnts)
```

Arguments

rekt	rectangle comprised of 4 points in counter clockwise direction.
pnts	set of points inside the rectangle

Details

Program is used for exploding symbols to the edge of the rectangle input

Value

list of new position x,y values

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

See Also

ExplodeSymbols

Examples

```
F1 = list(x=rnorm(20), y=rnorm(20))
r1 = range(F1$x)
r2 = range(F1$y)

r1 = c(r1[1]-0.1*diff(r1), r1[2]+0.1*diff(r1))
r2 = c(r2[1]-0.1*diff(r2), r2[2]+0.1*diff(r2))

rekt = list(x=c(r1[1], r1[2], r1[2], r1[1]), y=c(r2[1], r2[1], r2[2], r2[2]))
pnts = list(x1=rep(mean(r1), length(F1$x)), y1=rep(mean(r2), length(F1$y)), x2=F1$x, y2=F1$y)
NEW = rekt2line(rekt, pnts)

plot(range(c(F1$x, NEW$x)), range(c(F1$y, NEW$y)), type='n')
rect(r1[1], r2[1], r1[2], r2[2], border=grey(.75), lty=2)

points(F1, pch=2, col='blue')
segments(F1$x, F1$y, NEW$x, NEW$y)
points(NEW, pch=3, col='red')
```

rose	<i>Rose Diagram</i>
------	---------------------

Description

Rose diagram of angle orientations or directions

Usage

```
rose(angles, bins, x = 0, y = 0, col = "black", border = "black",
     annot = FALSE, main = "", prop = 1, pts = FALSE, cex = 1, pch = 16,
     dotsep = 40, siz = 1, LABS = LABS, LABangle = 180, add = FALSE, SYM = FALSE)
```

Arguments

angles	numeric, vector of angles in radians
bins	integer, number of bins
x	numeric, x location on page
y	numeric, y location on page
col	color for pie slices
border	color for pie borders
annot	logical, annotation
main	character, main title
prop	proportional plotting, default = 1
pts	logical, add points (default=FALSE)
cex	character expansion
pch	plotting character
dotsep	separation of dots
siz	size of plot
LABS	Labels
LABangle	angle for plotting Label angles
add	logical, add to plot (default=FALSE)
SYM	logical, symmetric rose diagram (FALSE)

Details

Create a rose diagram or add rose diagram to an existing plot. Used for plotting geographic orientations or directions.

Value

list:

usector	sector angles
uradius	sector radii
usizx	x size scale
usizy	y size scale
x	x center on page
y	y center on page

Note

For symmetric plots, bins are rotated and added together, then the reflection is made.

     annot=TRUE,border='white',LABangle=135, siz =sqrt(2), SYM=TRUE)
```

rotateGEOmap

Rotate a GEOmap

Description

Rotate a GEOmap to a new location on the globe

Usage

```
rotateGEOmap(INmap, TARGlat, TARGlon, LAT0, LON0, beta = 0)
```

Arguments

INmap	Input GEOmap
TARGlat	Target center latitude
TARGlon	Target center longitude
LAT0	Source center latitude
LON0	Source center longitude
beta	rotation through axis coming out of screen

Details

This function is used to translate a given map region to another for over plotting. You can compare the areas of two region using the same projection.

Value

GEOmap list.

```

rotdelta4

rotation about Z-axis

Description

rotation about Z-axis

Usage

```
rotdelta4(delta)
```

Arguments

delta angle in degrees

Value

Matrix for rotation

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

See Also

roty4, rotx4, trans4

Examples

```
rotdelta4(23)
```

rotmat2D	<i>set a rotation matrix</i>
----------	------------------------------

Description

set a rotation matrix

Usage

```
rotmat2D(alph)
```

Arguments

alph angle in radians

Value

matrix for rotation in 2 dimensions

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

Examples

```
##### make an ellipse
theta=seq(0,360,by=5)*pi/180

r1 = 0.4
r2 = 0.2

m=matrix(rep(0,2*length(theta)),ncol=2)

m[,1]=r1*cos(theta)
m[,2]=r2*sin(theta)

## make a dummy plot and draw ellipse

plot(c(0, 1), c(0, 1), main = "this is a test", sub = "suptitle",
      xlab = "this is x", ylab = "this is y")

lines(m[,1]+.5, m[,2]+.5)

## get rotation matrix
R = rotmat2D(32)

##### apply rotation
nm=m %%% R

### plot
lines(nm[,1]+.5, nm[,2]+.5, col='red')
```

rotx4	<i>x-axis rotation matrix</i>
-------	-------------------------------

Description

x-axis rotation matrix

Usage

```
rotx4(vec)
```

Arguments

vec vector of direction cosines

Details

Length of vector cannot be zero.

Value

Matrix for rotation

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

See Also

roty4(v)
```

SELGEOmap	Select parts of a GEOmap
-----------	--------------------------

Description

Using area, number of points and Lat-Lon Limits, extracts map strokes and creates a new GEOmap

Usage

```
SELGEOmap(MAP, ncut = 3, acut = c(0, 1e+05), proj = NULL, LIM = NULL)
```

Arguments

MAP	Map structure
ncut	minimum number of points in polygon
acut	vector, min and max of areas to include
proj	map projection
LIM	vector, c(lon1, lat1, lon2, lat2)

Details

Uses sf::st_area function. If proj and LIM are NULL then no selection on limits are used ncut is used to eliminate area calculations with strokes less than the specified number.

Value

GEOmap LIST	
STROKES	list
nam	name of stroke
num	number of points in stroke
index	index of stroke

col	color of stroke
style	style of stroke
code	code of stroke
LAT1	lower left Lat of stroke
LAT2	upper right Lat of stroke
LON1	lower left Lon of stroke
LON2	upper right Lon of stroke
POINTS	list
lat	vector of lats
lon	vector of lons

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

See Also

geoarea, sf::st_area

Examples

```
library(geomapdata)
data(worldmap)
skam = SELGEOMap(worldmap, ncut=3, acut=c(10000, Inf), proj=NULL, LIM=NULL)

par(mfrow=c(2,1))

##### plot world map, with all lines:
plotGEOMap(worldmap)
length(worldmap$STROKES$num)
##### same plot with some lines removed:
plotGEOMap(skam)
length(skam$STROKES$num)

#####
#####
```

setMarkup

Set up mark up for maps

Description

Interactive set up of mark of labels for a map

Usage

```
setMarkup(LABS = NULL, PROJ = NULL)
```

Arguments

LABS	vector of labels
PROJ	projection structure

Details

labels are set one-by-one and the user inout relevant information like locator() and other features

Value

List of Markup information

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

See Also

Markup

Examples

```
## Not run:

plot(c(0, 1), c(0, 1), main = "this is a test", sub = "sutable",
      xlab = "this is x", ylab = "this is y")

LABS = c("this is", "a", "test")

MUP = setMarkup(LABS)

## End(Not run)
```

setplotmat

set up matrices for selecting from eTOPO5

Description

set up matrices for selecting from eTOPO5

Usage

```
setplotmat(x, y)
```

Arguments

x	vector of lons
y	vector of lats

Details

For extracting from ETOPO5 and ETOPO2, used internally in DOTOPOMAPI

Value

list(x=EX, y=WHY)

Author(s)

Jonathan M. Lees<jonathan.lees.edu>

See Also

DOTOPOMAPI

Examples

```
PLOC= list(LON=c(138.3152, 139.0214),
LAT=c(35.09047, 35.57324))

ax = seq(from=PLOC$LON[1], to=PLOC$LON[2], length=10)
ay = seq(from=PLOC$LAT[1], to=PLOC$LAT[2], length=10)

G = setplotmat(ax,ay)
```

SETPOLIMAP

Set up polygons for World map Database

Description

Divides world into continents.

Usage

```
SETPOLIMAP()
```

Details

Used for CIA data base

Value

Returns GEOMap list of continents

STROKES	list(nam, num, index, col, style, code, LAT1, LAT2, LON1, LON2)
POINTS	list(lat, lon)
PROJ	list(type, LAT0, LON0, LAT1, LAT2, LATS, LONS, DLAT, DLON, FE, FN, name)

Author(s)

Jonathan M. Lees<jonathan.lees.edu>

See Also

selectPOLImap

Examples

```
LMAP = SETPOLIMAP()
```

setPROJ

Set Projection

Description

Setup parameters for Map Projection

Usage

```
setPROJ(type = 1, LAT0 = 0, LON0 = 0, LAT1 = 0, LAT2 = 0, LATS = NULL,
        LONS = NULL, DLAT = NULL, DLON = NULL, FE = 0, FN = 0, IDATUM=1)
```

Arguments

type	Type of projection
LAT0	Central Latitude
LON0	Central Longitude
LAT1	Latitude parameter for special projection, where needed
LAT2	Latitude parameter for special projection, where needed
LATS	vector of range of Latitudes
LONS	vector of range of Longitudes
DLAT	difference of Lats
DLON	difference of Lons
FE	False Easting
FN	False Northing
IDATUM	integer, index to the datum database

Details

Set up for the various projections used by GEOMap

Value

List of values described above

Note

Some of the parameters are not critical to all the choices of Map Projection. In that case they are set to defaults and ignored by that projection.

LONs are modified and rectified by fmod function.

The datum data base is accessed via the function DATUMInfo. There are 11 different projection datums. These are NAD83/WGS84, GRS 80, WGS72, Australian 1965, Krasovsky 1940, International (1924) -Hayford (1909), Clarke 1880, Clarke 1866, Airy 1830, Bessel 1841, Everest 1830.

Author(s)

Jonathan M. Lees<jonathan.lees.edu>

```

```
### No Projection
setPROJ(type = 0, LAT0 =23, LON0 = 35)
```

settopocol	<i>Topographic Color Map</i>
------------	------------------------------

Description

Set up vectors and structures for creating a color map for topographic plots

Usage

```
settopocol()
```

Details

RGB Colors are defined for topographic elevations and/or depths. The basic data is stored as z1 red1 green1 blue1 z2 red2 green2 blue2 and linear interpolation is used between elevations. The color set here extends from green in lowlands around sealevel through browns and light-browns through to whites at snow covered peaks.

Value

```
LIST:calcol=calcol , coltab=coltab

calcol      list(z1, r1,g1,b1, z2, r2,g2,b2, note)
coltab      color table, matrix
```

Author(s)

Jonathan M. Lees<jonathan.lees.edu>

Examples

```
settopocol()
```

sizelegend	<i>Magnitude size legend</i>
------------	------------------------------

Description

Plot a simple legend of magnitude sizes at the top of a plot.

Usage

```
sizelegend(se, am, pch = pch)
```

Arguments

se	vector, sizes
am	vector, labels
pch	plotting character

Details

A box around the legend is currently introduced.

Value

Graphical Side Effect

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

Examples

```
x = rnorm(30)
y = rnorm(30)

mags = runif(30, 1,8)

plot(x, y, type="n")

esiz = exp(mags)
rsiz = RPMG::RESCALE(esiz, .4, 10, min(esiz), max(esiz))
points(x, y, pch=1, cex=rsiz)

am = pretty(mags)
am = am[am>min(mags) & am<max(mags) ]

em = exp(am)
se = RPMG::RESCALE(em, .4, 10, min(esiz), max(esiz))
```

```
sizelegend(se, am, pch=1)
```

sqrTICXY

Tick marks for Square plot

Description

Lat-Lon Tick marks and grid for Square plot

Usage

```
sqrTICXY(prsurf, proj, side = c(1, 2, 3, 4), PMAT=NULL, LLgrid = TRUE,
  col = "black", colt = "black", font=5, cex=1, lty=2, lwd=1,
  pcex=1, TICS=NULL)
```

Arguments

prsurf	list with x, y
proj	projection
side	vector, which sides to plot, 1=bottom, 2=left, 3=top, 4=right
PMAT	projection matrix from persp
LLgrid	logical, whether to add grid
col	color for grid
colt	color for text
font	default=2, font for labels
cex	character expansion for tic labels
lty	Line type for lines, default=2
lwd	Line width for lines, default=1
pcex	character expansion for tics, pch=2
TICS	list(lat, lon) this will replace the default

Value

Graphical side effects

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

See Also

```

SSfault

Strike Slip Fault

Description

Plot a strike slip fault

Usage

```
SSfault(x, y, h = 1, hoff = 0.15, rot = list(cs = 1, sn = 0),
col = "black", dextral = TRUE, lwd = 1)
```

Arguments

x	x-coordinates
y	y-coordinates
h	length of symbol
hoff	distance from line
rot	rotation list
col	color
dextral	logical, TRUE=dextral polarity
lwd	line width

Details

Rotation vector is provided as list(cs=vector(), sn=vector()).

Value

Graphical Side effects

```

STROKEinfo	<i>Stroke Information</i>
------------	---------------------------

Description

print stroke information from a GEOMap data base

Usage

```
STROKEinfo(map, w = 1, h = NULL)
```

Arguments

- | | |
|-----|--|
| map | GEOMap data list |
| w | which strokes to extract, vector of number indices or single string to match names in data base list |
| h | numeric vector of columns of data base, or vector of characters to match names. |

Details

Uses grep to match names so can have short names

Value

data.frame of extracted strokes

Note

Use gsub to change the names of strokes.

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

See Also

gsub

Examples

```
data(coastmap)
STROKEinfo(coastmap, h="nam", w="Indo")

STROKEinfo(coastmap, w="Indo", h=c("nam", "col" ) )
```

subsetTOPO	<i>Subset a Topo map</i>
------------	--------------------------

Description

Extract a subset of a topo DEM

Usage

```
subsetTOPO(TOP0, ALOC, PROJ, nx=500, ny=500, nb = 4, mb = 4, hb = 8)
```

Arguments

TOP0	DEM list including x,y,z
ALOC	list including LAT LON vectors for extracting an array from the DEM
PROJ	projection
nx	number of points in x grid, default=500
ny	number of points in y grid, default=500
nb	see function mba.surf, default = 4
mb	see function mba.surf, default = 4
hb	see function mba.surf , default= 8

Details

Used for extracting a subset of ETOPO5 or ETOPO2.

ETOPO5 or ETOPO2 can be downloaded from and installed using these links: <http://leesj.sites.oasis.unc.edu/FETCH/GRAB/RPACKAGES/ETOP02.RData> and <http://leesj.sites.oasis.unc.edu/FETCH/GRAB/RPACKAGES/ETOP05.RData>

Value

x	vector x-coordinates
y	vector y-coordinates
z	2D matrix of elevations

Author(s)

Jonathan M. Lees<jonathan.lees.edu>

See Also

GEOTOPO

Examples

```

PROJ = setPROJ(type=2, LAT0=mean(PLOC$y) , LON0=mean(PLOC$x) )
JAPANtopo = subsetTOPO(ETOP05, PLOC, PROJ)

## End(Not run)
```

SynAnticline

Syncline and Anticline traces

Description

Syncline and Anticline traces

Usage

```
SynAnticline(x, y, syn = TRUE, spacing = NULL, N = 1, r1 = 1, r2 = 1.2,
             h1 = 0, h2 = 0, endtol = 0.1, REV = FALSE, col = "black", ...)
```

Arguments

x	x-coordinates
y	y-coordinates
syn	logical, TRUE=syncline, FALSE=anticline
spacing	spacing of points
N	number of points
r1	x-radius of curled part
r2	y-radius of curled part
h1	length of first leg

h2	length of 2nd leg
endtol	indent on either ends
REV	reverse direction of x-y
col	color of teeth and line
...	graphical parameters

Value

Graphical Side effect

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu

##### anticline
plot(c(-5,5), c(-5,5), asp=1, type='n' )

SynAnticline(G$x,G$y, N=5, syn=FALSE, endtol=.2)

##### syncline
plot(c(-5,5), c(-5,5), asp=1, type='n' )
SynAnticline(G$x,G$y, N=5, syn=FALSE, endtol=.2)
```

targetLL

Target Lat-Lon

Description

Get a target Lat-Lon from a set of Lat-Lon pairs

Usage

```
targetLL(sta, rdist = 100)
```

Arguments

sta	station list (with slots lat lon)
rdist	radius in km

Details

Uses the Median station as the center and returns the lat-lon extents of the target region.

Value

list(	
A	matrix with lat-lon pairs (lons=(0,360)
B	matrix with lat-lon pairs (lons=(-180, 180))
mlat	median latitude
m lon	median longitude
Jlat	range of lats
Jlon	range of lons
proj	projection list

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

Examples

```
sta=list( lat=rnorm(10, mean=60, sd=0.5),
lon = rnorm(10, mean=60, sd=0.5))

A = targetLL(sta, rdist = 100)
print(A)

sta=list( lat=rnorm(10, mean=-30, sd=0.5),
lon = rnorm(10, mean=-40, sd=0.5))

A = targetLL(sta, rdist = 100)
print(A)
```

teeth*Add Teeth to line*

Description

Add teeth marks to a line.

Usage

```
teeth(x, y, h, rot, col = "black", border = "black")
```

Arguments

x	x-coordinates
y	y coordinates
h	height of tooth
rot	rotation of teeth
col	color of line
border	color of border, default= col

Details

The rotation is usually determined by consecutive x-y points

Value

--------	---------------------

Description

Add Thrust fault with teeth on overlying block

Usage

```
thrust(x, y, h = 1, N=1, REV = FALSE, endtol=0.1, col = "black", ...)
```

Arguments

x	x-coordinates
y	y-coordinates
h	height of teeth
N	NUmber of points along line
endtol	percent tolerance on ends of line
REV	reverse direction of x-y (teeth on other side)
col	color of teeth and line
...	graphical parameters

Value

```

TOPOCOL

Create Topography ColorMAP

Description

Given an x-y-Z create a matrix of colors for plotting in persp

Usage

```
TOPOCOL(IZ, calcol)
```

Arguments

IZ	Matrix of values
calcol	Color mapping of elevations to rgb colors

Details

colors are interpolated between boundaries in the color map

Value

Matrix of colors suitable for insertion to persp

Author(s)

Jonathan M. Lees<jonathan.lees.edu>

```

trans4

Translation matrix

Description

Translation matrix for rotations

Usage

```
trans4(vec)
```

Arguments

vec 3 vector

Value

4 by 4 matrix

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

References

Rogers and Adams

See Also

rotx4, roty4, rotdelta4

Examples

```
trans4(c(0,0,0))
```

UTM.ll	<i>Map projection</i>
--------	-----------------------

Description

UTM Map projection parameters supplied and X-Y, return the LAT-LON values, WGS-84

Usage

```
UTM.ll(x , y , PROJ.DATA)
utm.wgs84.ll(x , y , PROJ.DATA)
```

Arguments

x	x
y	y
PROJ.DATA	list of projection parameters

Value

List	
phi	Latitude-coordinate
lam	Longitude-coordinate

Note

When calling the conversion from LL to XY or vice versa, convert the lon to 0 to 360. Use RPMG::fmod for this conversion. This may be rectified in future revisions.

Author(s)

Jonathan M. Lees<jonathan.lees.edu>

GLOB.XY, setPROJ

UTM.xy	<i>Map projection</i>
--------	-----------------------

Description

UTM Map projection parameters supplied and LAT-LON, return the x-y values, WGS-84 datum

Usage

```
UTM.xy(phideg, lamdeg, PROJ.DATA)
utm.wgs84.xy(phideg, lamdeg, PROJ.DATA)
```

Arguments

phideg	Latitude
lamdeg	Longitude
PROJ.DATA	list of projection parameters

Value

List	
x	x-coordinate
y	y-coordinate

Note

When calling the conversion from LL to XY or vice versa, convert the lon to 0 to 360. Use `RPMG::fmod` for this conversion. This may be rectified in future revisions.

```

lat = 40.5
lon = -73.50
lon0 = -75
LON = RPMG::fmod(lon, 360)

wproj = setPROJ(type = 5, LAT0 = 0 , LON0 = lon0 , FE = 0 )

u1 = utm.elps.xy(lat, LON ,wproj )
utm.wgs84.xy(lat, LON ,wproj)

#### also for more general UTM:
### this is the wgs84 projection
wproj1 = setPROJ(type = 8, LAT0 = 0 , LON0 = lon0 , FE = 0 , IDATUM=1 )
UTM.xy(lat, LON,wproj1)

### this is the Clark-1866 (see page 270 in Snyder)
wproj8 = setPROJ(type = 8, LAT0 = 0 , LON0 = lon0 , FE = 0 , IDATUM=8)
UTM.xy(lat, LON,wproj8)

## which is the same as:

uzone = UTMzone(lat, lon)

lon0 = uzone$CEN[2]
wproj = setPROJ(type = 5, LAT0 = 0 , LON0 = lon0 , FE = 500000 )
utm.elps.xy(lat, LON,wproj )

## to see all the Datums, use: DATUMinfo()
```

utmbox

Get UTM Box info

Description

Get UTM Box info

Usage

```
utmbox(lat, lon)
```

Arguments

lat	latitude
lon	longitude

Value

List:

lon	input point longitude
lat	input point latitude
LON	LL corner longitude
LAT	LL corner latitude
utmbox	List: x=utm number, y=utm letter
UTM0	List: center of box: lam=long, phi=lat

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

See Also

plotUTM

Examples

```
lat = 35.76658
lon = 279.4335
utmbox(lat, lon)
```

UTMzone

UTM zone information

Description

Return the UTM zone information

Usage

```
UTMzone(lat, lon = NA)
```

Arguments

lat	latitude
lon	longitude

Details

The function works two ways: If the lat-lon are numeric and lon is not NA then the UTM zone information is returned. If lon is NA and lat is one of the UTM zones, then the lat-lon information for that zone is returned.

Value

list:

zone	Character, zone designation
LON	longitude range of the zone
LAT	latitude range of the zone
CEN	center of the zone, used for projections

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

## or
UTMzone("18T")
```

X.prod	<i>Cross Product</i>
--------	----------------------

Description

Vector Cross Product for spatial cartesian vectors

Usage

X.prod(a, b)

Arguments

a	3-vector
b	3-vector

Value

3-vector

Author(s)

Jonathan M. Lees<jonathan.lees@unc.edu>

Examples

```
v1 = c(1,1,1)
v2= c(-1, -1, 1)
X.prod(v1, v2)
```

XSECDemg

Cross Sections Using RPMG

Description

This function Takes a Digital Elevation Map (or any surface) and illustrates how to take interactive cross sections with RPMG through the surface.

Usage

```
XSECDemg(Data, labs=NULL, pts=NULL, nlevels=10, demo=FALSE)
```

Arguments

Data	Structure with x, y, z components, typical of contoured surfaces or digital images
labs	Vector of labels for Buttons used in the RPMG
pts	Points to plot on map view
nlevels	Number of levels for contours
demo	Argument used to turn off interactive part. Default is FALSE, but for package construction is set to TRUE so no interaction is required.

Details

XSECDemg is an example stub illustrating the use of RPMG. The idea is to set up a while() loop that uses input from the locator() function to execute or analyze data depending on user defined buttons. Actions are executed when the button clicked matches the list of names provided by the user.

Value

No return values

Note

This code is designed as an example of how to set up a Really Poor Man's GUI. The demo argument is supplied so that this code will run without user input, as when creating a checks for package construction.

### in the following change demo=FALSE to get interactive behavior
XSECDEMG(volcano, mybutts, demo=TRUE)
```

XSECEQ	<i>Interactive earthquake cross section</i>
--------	---

Description

Iinteractive earthquake cross section

Usage

```
XSECEQ(MAP, EQ, XSECS = NULL, labs = c("DONE", "REFRESH", "XSEC",
"MSEC"),
width = 10, kmaxes = TRUE, pch = ".", demo = FALSE, png=FALSE )
```

Arguments

MAP	Geologic Map Structure
EQ	list of earthquakes
XSECS	list of cross sections
labs	labels for cross sections
width	width of swaths
kmaxes	logical, TRUE=keep all cross sections same depth
pch	plotting character
demo	Logical, TRUE=not-interactive
png	Logical, TRUE=create png files of the cross sections

Value

Graphical side effects and creates cross-sectional swaths returned as a list, see eqswath for list structure.

XY.GLOB	<i>Convert from XY to GLOBAL LAT-LON</i>
---------	--

Description

Convert from XY to GLOBAL LAT-LON

Usage

XY.GLOB(x, y, PROJ.DATA)

Arguments

x	X in whatever units
y	Y in whatever units
PROJ.DATA	Projection list

Details

Units are whatever is returned from the projection definition. This is the inverse of GLOB.XY.

Value

If it is a LIST, use

lat	Latitude
lon	Longitude
...	

Author(s)

Jonathan M. Lees<jonathan.lees.edu>

References

Snyder, John P., Map Projections- a working manual, USGS, Professional Paper, 1987.

zebra	<i>Horizontal Zebra Scale</i>
-------	-------------------------------

Description

Plot a zebra style horizontal scale on a projected map.

Usage

```
zebra(x, y, Dx, dx, dy, lab = "", pos=1, col = c("black", "white"),  
cex = 1, textcol="black", xpd=TRUE, PMAT = NULL)
```

Arguments

x	x-coordinate of left corner
y	y-coordinate of left corner
Dx	distance in x, km
dx	distance for zebra stripes in x
dy	thickness in km
lab	labels
pos	position of text, 1=below, 3=above, as in par
col	2-vector of colors, for the alternating bars
cex	character expansion
textcol	color for the text
xpd	logical, graphic parameter for clipping (see par)
PMAT	3D projection matrix from persp

Details

Plots a zebra style kilometer scale on the current plot

Value

Graphical Side effect
