

# Package ‘LMD’

July 21, 2025

**Type** Package

**Date** 2022-09-10

**Title** A Self-Adaptive Approach for Demodulating Multi-Component Signal

**Version** 1.0.0

**Maintainer** Shubhra Prakash <shubhraprakash279@gmail.com>

**Description** Local Mean Decomposition is an iterative and self-adaptive approach for demodulating, processing, and analyzing multi-component amplitude modulated and frequency modulated signals. This R package is based on the approach suggested by Smith (2005) <[doi:10.1098/rsif.2005.0058](https://doi.org/10.1098/rsif.2005.0058)> and the 'Python' library 'PyLMD'.

**License** Apache License (>= 2)

**Depends** R (>= 3.6.0)

**BugReports** <https://github.com/shubhra-opensource/LMD/issues>

**URL** <https://github.com/shubhra-opensource/LMD>

**Encoding** UTF-8

**RoxygenNote** 7.2.1

**Suggests** knitr, rmarkdown, ggformula, testthat (>= 3.0.0)

**Config/testthat/edition** 3

**VignetteBuilder** knitr

**Imports** EMD, ggplot2, patchwork

**NeedsCompilation** no

**Author** Shubhra Prakash [trl, aut, cre]

**Repository** CRAN

**Date/Publication** 2022-09-20 09:56:07 UTC

|---------------------------------|
| extract_product_function        |
| <i>Extract Product Function</i> |

---

**Description**

Method for extracting product functions

**Usage**

```
extract_product_function(  
    signal,  
    max_envelope_iteration = 200,  
    envelope_epsilon = 0.01,  
    convergence_epsilon = 0.01  
)
```

**Arguments**

- signal                      Signal values (Numeric | vector)
- max\_envelope\_iteration                      Maximum number of iterations when separating local envelope signals (Integer)
- envelope\_epsilon                      Terminate processing when obtaining pure FM signal (Double)
- convergence\_epsilon                      Terminate processing when modulation signal converges (Double)

**Value**

Product Function

**Author(s)**

Shubhra Prakash, <shubhraprakash279@gmail.com>

**References**

<https://pypi.org/project/PyLMD/>

**Examples**

```
x=1:100
y = (2 / 3)* sin(x * 30) + (2 / 3) * sin(x * 17.5) + (4 / 5) *cos(x * 2)
plot(y,type="l")
pf=extract_product_function(y)
```

---

find\_extrema*Find Extreme Points*

---

**Description**

Method for finding Extreme Points

**Usage**

```
find_extrema(signal, include_endpoints = TRUE)
```

**Arguments**

|                   |                                                |
|-------------------|------------------------------------------------|
| signal            | Signal values (Numeric   vector)               |
| include_endpoints | whether to include end points or not (Boolean) |

**Details**

A local extrema is the point at which a maximum or minimum value of the function in some open interval containing the point is obtained.

**Value**

Indexes of all extrema values (including starting and ending points)

**Author(s)**

Shubhra Prakash, <shubhraprakash279@gmail.com>

**Examples**

```
signal=c( 0.841471 ,0.9092974,0.14112,-0.7568025,-0.9589243)
find_extrema(signal)
```

is\_monotonous

*Monotonicity Check*

---

**Description**

Method for checking if signal is increasing or decreasing monotonously

**Usage**

```
is_monotonous(signal)
```

**Arguments**

signal                      Signal values (Numeric | vector)

**Details**

A monotonic signal is a function that keeps increasing or decreasing as its domain variable proceeds.#'

**Value**

Boolean

**Author(s)**

Shubhra Prakash, <shubhraprakash279@gmail.com>

**References**

<https://pypi.org/project/PyLMD/>

**Examples**

```
x=1:100  
is_monotonous(x)
```

lmd

*Local Mean Decomposition***Description**

Method for finding Product Functions (PFs)

**Usage**

```
lmd(
  signal,
  include_endpoints = TRUE,
  max_smooth_iteration = 12,
  max_envelope_iteration = 200,
  envelope_epsilon = 0.01,
  convergence_epsilon = 0.01,
  max_num_pf = 8
)
```

**Arguments**

|                        |                                                                                 |
|------------------------|---------------------------------------------------------------------------------|
| signal                 | Signal values (Numeric   vector)                                                |
| include_endpoints      | Whether to treat the endpoint of the signal as a pseudo-extreme point (Boolean) |
| max_smooth_iteration   | Maximum number of iterations of moving average algorithm (Integer)              |
| max_envelope_iteration | Maximum number of iterations when separating local envelope signals (Integer)   |
| envelope_epsilon       | Terminate processing when obtaining pure FM signal (Double)                     |
| convergence_epsilon    | Terminate processing when modulation signal converges (Double)                  |
| max_num_pf             | The maximum number of PFs generated(Integer)                                    |

**Details**

LMD is a method of decomposing signal into Product Functions (PFs) based on algorithm presented in Jonathan S. Smith. The local mean decomposition and its application to EEG perception data. Journal of the Royal Society Interface, 2005, 2(5):443-454

**Value**

list(pf,residue) | PFs:The decompose functions arranged from high frequency to low frequency |  
residue:residual component

**Author(s)**

Shubhra Prakash, <shubhraprakash279@gmail.com>

**References**

<https://pypi.org/project/PyLMD/>

**Examples**

```
x=1:100
y = (2 / 3 ) * sin(x * 30) + (2 / 3) * sin(x * 17.5) + (4 / 5) * cos(x * 2)
plot(y, type="l")
lmd(y)
```

---

local\_mean\_and\_envelope

*Local Mean and Envelope*

---

**Description**

Method for finding Local Mean and Envelope

**Usage**

```
local_mean_and_envelope(signal, extrema)
```

**Arguments**

|         |                                  |
|---------|----------------------------------|
| signal  | Signal values (Numeric   vector) |
| extrema | indexes for extreme values       |

**Value**

mean, envelope and smoothed mean and envelope values

**Author(s)**

Shubhra Prakash, <shubhraprakash279@gmail.com>

**References**

<https://pypi.org/project/PyLMD/>

**Examples**

```
signal = sin(1:10)
extrema = c(1, 2, 5, 8, 10)
local_mean_and_envelope(signal, extrema)
```

---

moving\_average\_smooth    *Weighted Moving Average*

---

## Description

Weighted Moving Average Smoothing

## Usage

```
moving_average_smooth(signal, window, max_smooth_iteration = 12)
```

## Arguments

|                      |                                                                    |
|----------------------|--------------------------------------------------------------------|
| signal               | Signal values (Numeric   vector)                                   |
| window               | filter weights for smoothing (Numeric   vector)                    |
| max_smooth_iteration | Maximum number of iterations of moving average algorithm (Integer) |

## Details

Weighted Moving Average Smoothing is used to smooth en the mean and envelope signal

## Value

smooth signal

## Author(s)

Shubhra Prakash, <shubhraprakash279@gmail.com>

## References

<https://pypi.org/project/PyLMD/>

## Examples

```
x=0:100
y = (2 / 3 )* sin(x * 30) + (2 / 3) * sin(x * 17.5) + (4 / 5) *cos(x * 2)
plot(y,type="l")
wma=moving_average_smooth(y,5)
plot(wma,type="l")
```

plot\_lmd

*LMD Plot***Description**

Method for plotting Product Functions (PFs) and Residue

**Usage**

```
plot_lmd(
  lmd_obj,
  max_pf = length(lmd_obj[["pf"]]),
  show_residue = TRUE,
  pricolor_plot = "midnightblue",
  line_size_plot = 1
)
```

**Arguments**

|                |                                      |
|----------------|--------------------------------------|
| lmd_obj        | LMD object created from LMD function |
| max_pf         | Number of PFs to Plot                |
| show_residue   | Whether to plot residue or not       |
| pricolor_plot  | color of plots                       |
| line_size_plot | Size of line in ggplot               |

**Value**

ggplot plot for Product Functions (PFs) and Residue

**Author(s)**

Shubhra Prakash, <shubhraprakash279@gmail.com>

**Examples**

```
x=1:100
y = (2 / 3 ) * sin(x * 30) + (2 / 3) * sin(x * 17.5) + (4 / 5) * cos(x * 2)
plot_lmd(lmd(y))
```
