Package 'Lahman'

July 21, 2025

Type Package

Title Sean 'Lahman' Baseball Database

Version 12.0-0

Date 2024-09-24

Author Michael Friendly [aut],
Chris Dalzell [cre, aut],
Martin Monkman [aut],
Dennis Murphy [aut],
Vanessa Foot [ctb],
Justeena Zaki-Azat [ctb],
Sean Lahman [cph]

Maintainer Chris Dalzell <cdalzell@gmail.com>

Description Provides the tables from the 'Sean Lahman Baseball Database' as
a set of R data.frames. It uses the data on pitching, hitting and fielding
performance and other tables from 1871 through 2023, as recorded in the 2024
version of the database. Documentation examples show how many baseball
questions can be investigated.

Language en-US

Depends R (>= 3.5.0)

Suggests lattice, ggplot2, googleVis, data.table, vcd, reshape2,
tidyr, knitr, rmarkdown, car

Contents

| Lahman-package | *Sean Lahman's Baseball Database* |

Description

This database contains pitching, hitting, and fielding statistics for Major League Baseball from 1871 through 2023. It includes data from the two current leagues (American and National), the four other "major" leagues (American Association, Union Association, Players League, and Federal League), and the National Association of 1871-1875.

This database was created by Sean Lahman, who pioneered the effort to make baseball statistics freely available to the general public. What started as a one man effort in 1994 has grown tremendously, and now a team of researchers have collected their efforts to make this the largest and most accurate source for baseball statistics available anywhere.

This database, in the form of an R package offers a variety of interesting challenges and opportunities for data processing and visualization in R.

In the current version, the examples make extensive use of the dplyr package for data manipulation (tabulation, queries, summaries, merging, etc.), reflecting the original relational database design and ggplot2 for graphics.

Details

Package:	Lahman
Type:	Package
Version:	12.0-0
Date:	2024-08-24
License:	GPL version 2 or newer
LazyLoad:	yes
LazyData:	yes

The main form of this database is a relational database in Microsoft Access format. The design follows these general principles: Each player is assigned a unique code (playerID). All of the information in different tables relating to that player is tagged with his playerID. The playerIDs are linked to names and birthdates in the People table. Similar links exist among other tables via analogous *ID variables.

The database is composed of the following main tables:

People Player names, dates of birth, death and other biographical info

Batting batting statistics

Pitching pitching statistics

Fielding fielding statistics

A collection of other tables is also provided:

Teams:

Teams	yearly stats and standings
TeamsHalf	split season data for teams
TeamsFranchises	franchise information

Post-season play:

BattingPost	post-season batting statistics
PitchingPost	post-season pitching statistics
FieldingPost	post-season fielding data
SeriesPost	post-season series information

Awards:

AwardsManagers	awards won by managers
AwardsPlayers	awards won by players
AwardsShareManagers	award voting for manager awards
AwardsSharePlayers	award voting for player awards

Hall of Fame: links to People via hofID

HallOfFame	Hall of Fame voting data

Other tables:

AllstarFull - All-Star games appearances; Managers - managerial statistics; FieldingOF - outfield position data; ManagersHalf - split season data for managers; Salaries - player salary data; Appearances - data on player appearances; Schools - Information on schools players attended; CollegePlaying - Information on schools players attended, by player and year;

Variable label tables are provided for some of the tables:

battingLabels, pitchingLabels, fieldingLabels

AllstarFull	*AllstarFull table*

Description

All Star appearances by players

Usage

```
data(AllstarFull)
```

Format

A data frame with 5673 observations on the following 8 variables.

playerID Player ID code

yearID Year

gameNum Game number (for years in which more than one game was played)

gameID Game ID code

teamID Team; a factor

lgID League; a factor with levels AL NL

GP Game played (zero if player did not appear in game)

startingPos If the player started, what position he played

Source

Lahman, S. (2024) Lahman's Baseball Database, 1871-2023, 2024 version, http://www.seanlahman.com/

Examples

```
data(AllstarFull)

# find number of appearances by players in the All Star games
player_appearances <- with(AllstarFull, rev(sort(table(playerID))))

# How many All-Star players, in total?
length(player_appearances)

# density plot of the whole distribution
plot(density(player_appearances), main="Player appearances in All Star Games")
rug(jitter(player_appearances))

# who has played in more than 10 ASGs?
player_appearances[player_appearances > 10]
hist(player_appearances[player_appearances > 10])
```

```
# Hank Aaron's All-Star record:
subset(AllstarFull, playerID == "aaronha01")

# Years that Stan Musial played in the ASG:
with(AllstarFull, yearID[playerID == "musiast01"])

# Starting positions he played (NA means did not start)
with(AllstarFull, startingPos[playerID == "musiast01"])

# All-Star rosters from the 1966 ASG
subset(AllstarFull, gameID == "NLS196607120")

# All-Stars from the Washington Nationals
subset(AllstarFull, teamID == "WAS")

# Teams with the fewest All-Stars
rare <- names(which(table(AllstarFull$teamID) < 10))

# Records associated with the 'rare' teams:
# (There are a few teamID typos: can you spot them?)
subset(AllstarFull, teamID %in% rare)
```

Appearances   *Appearances table*

Description

Data on player appearances

Usage

```
data(Appearances)
```

Format

A data frame with 113720 observations on the following 21 variables.

yearID Year

teamID Team; a factor

lgID League; a factor with levels AA AL FL NL PL UA

playerID Player ID code

G_all Total games played

GS Games started

G_batting Games in which player batted

G_defense Games in which player appeared on defense

G_p Games as pitcher

`G_c` Games as catcher

`G_1b` Games as firstbaseman

`G_2b` Games as secondbaseman

`G_3b` Games as thirdbaseman

`G_ss` Games as shortstop

`G_lf` Games as leftfielder

`G_cf` Games as centerfielder

`G_rf` Games as right fielder

`G_of` Games as outfielder

`G_dh` Games as designated hitter

`G_ph` Games as pinch hitter

`G_pr` Games as pinch runner

Details

The Appearances table in the original version has some incorrect variable names. In particular, the 5th column is `career_year`.

  summarise(G = sum(G)) %>%
  arrange(desc(G)) %>%
  do(head(., 1))
```

AwardsManagers   *AwardsManagers table*

Description

Award information for managers awards

Usage

```
data(AwardsManagers)
```

Format

A data frame with 193 observations on the following 6 variables.

playerID Manager (player) ID code

awardID Name of award won

yearID Year

lgID League; a factor with levels AL NL

tie Award was a tie (Y or N)

notes Notes about the award

Source

Lahman, S. (2024) Lahman's Baseball Database, 1871-2023, 2024 version, http://www.seanlahman.com/

Examples

```
# Post-season managerial awards

# Number of recipients of each award by year
with(AwardsManagers, table(yearID, awardID))

# 1996 award winners
subset(AwardsManagers, yearID == 1996)

# AL winners of the BBWAA managerial award
subset(AwardsManagers, awardID == "BBWAA Manager of the year" &
                        lgID == "AL")

# Tony LaRussa's manager of the year awards
subset(AwardsManagers, playerID == "larusto01")
```

AwardsPlayers   *AwardsPlayers table*

Description

Award information for players awards

Usage

```
data(AwardsPlayers)
```

Format

A data frame with 6797 observations on the following 6 variables.

playerID Player ID code

awardID Name of award won

yearID Year

lgID League; a factor with levels AA AL ML NL

tie Award was a tie (Y or N)

notes Notes about the award

library("lattice")
dotplot(awardtab)

# Restrict to MVP awards
mvp <- subset(AwardsPlayers, awardID == "Most Valuable Player")
# Who won in 1994?
mvp[mvp$yearID == 1994L, ]

goldglove <- subset(AwardsPlayers, awardID == "Gold Glove")
# which players won most often?
GGcount <- table(goldglove$playerID)
GGcount[GGcount>10]
```

```
# Triple Crown winners
subset(AwardsPlayers, awardID == "Triple Crown")

# Simultaneous Triple Crown and MVP winners
# (compare merged file to TC)
TC <- subset(AwardsPlayers, awardID == "Triple Crown")
MVP <- subset(AwardsPlayers, awardID == "Most Valuable Player")
keepvars <- c("playerID", "yearID", "lgID.x")
merge(TC, MVP, by = c("playerID", "yearID"))[ ,keepvars]
```

AwardsShareManagers   *AwardsShareManagers table*

Description

Award voting for managers awards

Usage

```
data(AwardsShareManagers)
```

Format

A data frame with 510 observations on the following 7 variables.

awardID name of award votes were received for

yearID Year

lgID League; a factor with levels AL NL

playerID Manager (player) ID code

pointsWon Number of points received

pointsMax Maximum number of points possible

votesFirst Number of first place votes

Source

Lahman, S. (2024) Lahman's Baseball Database, 1871-2023, 2023 version, http://www.seanlahman.com/

Examples

```
# Voting for the BBWAA Manager of the Year award by year and league

require("dplyr")

# Sort in decreasing order of points by year and league
AwardsShareManagers %>%
   group_by(yearID, lgID) %>%
   arrange(desc(pointsWon))

# Any unanimous winners?
AwardsShareManagers %>%
  filter(pointsWon == pointsMax)

# Manager with highest proportion of possible points
AwardsShareManagers %>%
   mutate(propWon = pointsWon/pointsMax) %>%
   arrange(desc(propWon)) %>%
   head(., 1)

# Bobby Cox's MOY vote tallies
AwardsShareManagers %>%
  filter(playerID == "coxbo01")
```

AwardsSharePlayers   *AwardsSharePlayers table*

Description

Award voting for managers awards

Usage

```
data(AwardsSharePlayers)
```

Format

A data frame with 7447 observations on the following 7 variables.

awardID name of award votes were received for

yearID Year

lgID League; a factor with levels AL ML NL

playerID Player ID code

pointsWon Number of points received

pointsMax Maximum number of points possible

votesFirst Number of first place votes

Source

Lahman, S. (2024) Lahman's Baseball Database, 1871-2023, 2023 version, http://www.seanlahman.com/

Examples

```
# Vote tallies for post-season player awards

require("dplyr")

# Which awards are represented in this data frame?
unique(AwardsSharePlayers$awardID)

# Sort the votes for the Cy Young award in decreasing order.
# Until 1967, the award went to the best pitcher
# in both leagues.

cyvotes <- AwardsSharePlayers %>%
             filter(awardID == "Cy Young") %>%
             group_by(yearID, lgID) %>%

  arrange(desc(n_top3)) %>%
  filter(n_top3 > 6)
```

Batting   *Batting table*

Description

Batting table - batting statistics

Usage

```
data(Batting)
```

Format

A data frame with 113799 observations on the following 22 variables.

playerID Player ID code

yearID Year

stint player's stint (order of appearances within a season)

teamID Team; a factor

lgID League; a factor with levels AA AL FL NL PL UA

G Games: number of games in which a player played

AB At Bats

R Runs

H Hits: times reached base because of a batted, fair ball without error by the defense

X2B Doubles: hits on which the batter reached second base safely

X3B Triples: hits on which the batter reached third base safely

HR Homeruns

RBI Runs Batted In

SB Stolen Bases

CS Caught Stealing

BB Base on Balls

SO Strikeouts

IBB Intentional walks

HBP Hit by pitch

SH Sacrifice hits

SF Sacrifice flies

GIDP Grounded into double plays

Details

Variables X2B and X3B are named 2B and 3B in the original database

battingLabels   *Variable Labels*

Description

These data frames provide descriptive labels for the variables in the Batting, Pitching and Fielding files (and related *Post files). They are useful for plots and other output using Label.

Usage

```
data(battingLabels)

data(fieldingLabels)

data(pitchingLabels)
```

Format

Each is data frame with observations on the following 2 variables.

variable variable name

label variable label

See Also

Label

Examples

```
data(battingLabels)
str(battingLabels)

require("dplyr")

# find and plot maximum number of homers per year
batHR <- Batting %>%
           filter(!is.na(HR)) %>%
           group_by(yearID) %>%
           summarise(max=max(HR))

with(batHR, {
  plot(yearID, max,
```

```
      xlab=Label("yearID"), ylab=paste("Maximum", Label("HR")),
      cex=0.8)
  lines(lowess(yearID, max), col="blue", lwd=2)
  abline(lm(max ~ yearID), col="red", lwd=2)
})
```

BattingPost   *BattingPost table*

Description

Post season batting statistics

Usage

```
data(BattingPost)
```

Format

A data frame with 16857 observations on the following 22 variables.

yearID Year
round Level of playoffs
playerID Player ID code
teamID Team
lgID League; a factor with levels AA AL NL
G Games
AB At Bats
R Runs
H Hits
X2B Doubles
X3B Triples
HR Homeruns
RBI Runs Batted In
SB Stolen Bases
CS Caught stealing

Examples

```
# Post-season batting data
# Requires care since intra-league playoffs have evolved since 1969
# Simplest case: World Series

require("dplyr")

# Create a sub-data frame for modern World Series play
ws <- BattingPost %>%
        filter(round == "WS" & yearID >= 1903) %>%
        mutate(BA = 0 + (AB > 0) * round(H/AB, 3),
               TB = H + X2B + 2 * X3B + 3 * HR,
               SA = 0 + (AB > 0) * round(TB/AB, 3),
               PA = AB + BB + IBB + HBP + SH + SF,
               OB = H + BB + IBB + HBP,
               OBP = 0 + (AB > 0) * round(OB/PA, 3) )

# Players with most appearances in the WS:
ws %>% group_by(playerID) %>%
        summarise(appearances = n()) %>%
        arrange(desc(appearances)) %>%
        head(., 10)

# Non-Yankees with most WS appearances
ws %>% filter(teamID != "NYA") %>%
        group_by(playerID) %>%
        summarise(appearances = n()) %>%
        arrange(desc(appearances)) %>%
        head(., 10)

# Top ten single WS batting averages ( >= 10 AB )
ws %>% filter(AB > 10) %>%
        arrange(desc(BA)) %>%
        head(., 10)

# Top ten slugging averages in a single WS
ws %>% filter(AB > 10) %>%
  arrange(desc(SA)) %>%
  head(., 10)

# Hitting stats for the 1946 St. Louis Cardinals, ordered by BA
```

```
ws %>%
  filter(teamID == "SLN" & yearID == 1946) %>%
  arrange(desc(BA))

# Babe Ruth's WS profile
ws %>%
  filter(playerID == "ruthba01") %>%
  arrange(yearID)
```

---

battingStats   *Calculate additional batting statistics*

Description

The Batting does not contain batting statistics derived from those present in the data.frame. This function calculates batting average (BA), plate appearances (PA), total bases (TB), slugging percentage (SlugPct), on-base percentage (OBP), on-base percentage + slugging (OPS), and batting average on balls in play (BABIP) for each record in a Batting-like data.frame.

Usage

```
battingStats(data = Lahman::Batting,
             idvars = c("playerID", "yearID", "stint", "teamID", "lgID"),
             cbind = TRUE)
```

Arguments

data	input data, typically Batting
idvars	ID variables to include in the output data.frame
cbind	If TRUE, the calculated statistics are appended to the input data as additional columns

Details

Standard calculations, e.g., BA <- H/AB are problematic because of the presence of NAs and zeros. This function tries to deal with those problems.

Value

A data.frame with all the observations in data. If cbind==FALSE, only the idvars and the calculated variables are returned.

Author(s)

Michael Friendly, Dennis Murphy

Examples

```
bstats <- battingStats()
str(bstats)
bstats <- battingStats(cbind=FALSE)
str(bstats)
```

CollegePlaying *CollegePlaying table*

Description

Information on schools players attended, by player

Usage

```
data(CollegePlaying)
```

Format

A data frame with 17350 observations on the following 3 variables.

playerID Player ID code

schoolID school ID code

yearID Year player attended school

Details

This data set reflects a change in the Lahman schema for the 2015 version. The old SchoolsPlayers table was replaced with this new table called CollegePlaying.

According to the documentation, this change reflects advances in the compilation of this data, largely led by Ted Turocy. The old table reported college attendance for major league players by listing a start date and end date. The new version has a separate record for each year that a player attended. This allows us to better account for players who attended multiple colleges or skipped a season, as well as to identify teammates.

Description

Outfield position data: information about positions played in the outfield

Usage

```
data(FieldingOF)
```

Format

A data frame with 12380 observations on the following 6 variables.

playerID Player ID code

yearID Year

stint player's stint (order of appearances within a season)

Glf Games played in left field

Gcf Games played in center field

Grf Games played in right field

Source

Lahman, S. (2024) Lahman's Baseball Database, 1871-2023, 2024 version, `http://www.seanlahman.com/`

Examples

```
require("dplyr")
require("tidyr")

## Data set only goes through 1955
## Can get a more complete record from the Fielding data frame
## or from the Appearances data (see below)

## Output directly from the FieldingOF data

## Barry Bonds (no records: post-1955 player)
FieldingOF %>%
   filter(playerID == "bondsba01")

## Willie Mays (first few years)
FieldingOF %>%
  filter(playerID == "mayswi01")

## Ty Cobb (complete)
FieldingOF %>%
  filter(playerID == "cobbty01")

## One way to get OF game information from the Fielding data
## Note: OF games != sum(LF, CF, RF) because players can switch
## OF positions within a game. Players can also switch from
## other positions to outfield during a game. OF represents
## the number of games a player started in the outfield.
Fielding %>%
   select(playerID, yearID, stint, POS, G) %>%
   filter(POS %in% c("LF", "CF", "RF", "OF")) %>%
   tidyr::spread(POS, G, fill = 0) %>%
   filter(playerID == "trumbma01")

## Another way is through the Appearances data (no stint).
## Provides a somewhat nicer table than the above.

## Mark Trumbo (active player)
Appearances %>%
   select(playerID, yearID, G_lf, G_cf, G_rf, G_of) %>%
   filter(playerID == "trumbma01")

## A slightly better format, perhaps
Appearances %>%
  select(playerID, yearID, G_lf, G_cf, G_rf, G_of) %>%
  rename(LF = G_lf, CF = G_cf, RF = G_rf, OF = G_of) %>%
  filter(playerID == "trumbma01")

## Willie Mays (1951-1973)
Appearances %>%
  select(playerID, yearID, G_lf, G_cf, G_rf, G_of) %>%
  filter(playerID == "mayswi01")
```

```
## Joe DiMaggio (1936-1951)
Appearances %>%
  select(playerID, yearID, G_lf, G_cf, G_rf, G_of) %>%
  filter(playerID == "dimagjo01")
```

HallOfFame   *Hall of Fame Voting Data*

Description

Hall of Fame table. This is composed of the voting results for all candidates nominated for the
Baseball Hall of Fame.

Usage

```
data(HallOfFame)
```

Format

A data frame with 6382 observations on the following 9 variables.

playerID Player ID code

yearID Year of ballot

votedBy Method by which player was voted upon. See Details

ballots Total ballots cast in that year

needed Number of votes needed for selection in that year

votes Total votes received

inducted Whether player was inducted by that vote or not (Y or N)

category Category of candidate; a factor with levels Manager Pioneer/Executive Player Umpire

needed_note Explanation of qualifiers for special elections

Details

This table links to the People table via the playerID.

votedBy: Most Hall of Fame inductees have been elected by the Baseball Writers Association of
America (BBWAA). Rules for election are described in https://en.wikipedia.org/wiki/National_
Baseball_Hall_of_Fame_and_Museum#Selection_process.

# Note 1: Only two players whose maximum voting percentage
# was over 60% were not eventually inducted
# into the HOF: Gil Hodges and Jack Morris.
# Red Ruffing was elected in a 1967 runoff election while
# the others have been voted in by the Veterans Committee.

# Note 2: Of the players whose slope was >= 2.5 among
# non-inductees, only Jack Morris has not (yet) been
# subsequently inducted into the HOF; however, his last year of
# eligibility was 2014 so he could be inducted by a future
# Veterans Committee.
```

HomeGames	*HomeGames table*

Description

Data mapping teams to the stadiums they played regular season games in as the home team.

Usage

```
data(HomeGames)
```

Format

A data frame with 3233 observations on the following 9 variables.

year.key Year

league.key League; a factor with levels AA AL FL NL PL UA

team.key Team; a factor

park.key Unique identifier for each ballpark

span.first First date the park began acting as home field for the team

span.last Last date the park began acting as home field for the team

games Total games in this time span

openings Total opening in this time span

attendance Total attendance in this time span

  group_by(year.key) %>%
  summarize(total.attendance = sum(attendance)) %>%
  arrange(year.key)
```

Label   *Extract the Label for a Variable*

Description

Extracts the label for a variable from one or more of the *Labels files. This is useful for plots and other displays because the variable names are often cryptically short.

Usage

```
Label(var, labels = rbind(Lahman::battingLabels,
                          Lahman::pitchingLabels,
                          Lahman::fieldingLabels))
```

Arguments

var	name of a variable
labels	label table(s) to search, a 2-column dataframe containing variable names and labels.

Value

Returns the variable label, or var if no label is found

Author(s)

Michael Friendly

See Also

[battingLabels](), [pitchingLabels](), [fieldingLabels]()

Examples

```
require("dplyr")
# find and plot maximum number of homers per year
batHR <- Batting %>%
          filter(!is.na(HR)) %>%
          group_by(yearID) %>%
          summarise(max = max(HR))

with(batHR, {
  plot(yearID, max,
       xlab=Label("yearID"), ylab=paste("Maximum", Label("HR")),
       cex=0.8)
  lines(lowess(yearID, max), col="blue", lwd=2)
  abline(lm(max ~ yearID), col="red", lwd=2)

```

LahmanData   *Lahman Datasets*

Description

This dataset gives a concise description of the data files in the Lahman package. It may be useful for computing on the various files.

Usage

```
data(LahmanData)
```

Format

A data frame with 24 observations on the following 5 variables.

file name of dataset

class class of dataset

nobs number of observations

nvar number of variables

title dataset title

Details

This dataset is generated using vcdExtra::datasets(package="Lahman") with some post-processing.

Examples

```
data(LahmanData)

# find ID variables in the datasets
IDvars <- lapply(LahmanData[,"file"], function(x) grep('.*ID$', colnames(get(x)), value=TRUE))
names(IDvars) <- LahmanData[,"file"]
str(IDvars)
# vector of unique ID variables
unique(unlist(IDvars))

# which datasets have playerID?
names(which(sapply(IDvars, function(x) "playerID" %in% x)))

##################################################
# Visualize relations among datasets via an MDS
##################################################
# jaccard distance between two sets; assure positivity
jaccard <- function(A, B) {
max(1 - length(intersect(A,B)) / length(union(A,B)), .00001)
}

distmat <- function(vars, FUN=jaccard) {
nv <- length(vars)
d <- matrix(0, nv, nv, dimnames=list(names(vars), names(vars)))

for(i in 1:nv) {
for (j in 1:nv) {
if (i != j) d[i,j] <- FUN(vars[[i]], vars[[j]])
}
}

d[is.nan(d)] = 0

d
}

# do an MDS on distances
distID <- distmat(IDvars)
config <- cmdscale(distID)

plot(config[,1], config[,2], xlab = "", ylab = "", asp = 1, axes=FALSE,
main="MDS of ID variable distances of Lahman tables")
abline(h=0, v=0, col="gray80")
text(config[,1], config[,2], rownames(config), cex = 0.75, pos=pos, xpd=NA)
```

Managers *Managers table*

Description

Managers table: information about individual team managers, teams they managed and some basic statistics for those teams in each year.

Usage

```
data(Managers)
```

Format

A data frame with 3749 observations on the following 10 variables.

playerID Manager (player) ID code

yearID Year

teamID Team; a factor

lgID League; a factor with levels AA AL FL NL PL UA

inseason Managerial order. Zero if the individual managed the team the entire year. Otherwise denotes where the manager appeared in the managerial order (1 for first manager, 2 for second, etc.)

G Games managed

W Wins

L Losses

rank Team's final position in standings that year

plyrMgr Player Manager (denoted by 'Y'); a factor with levels N Y

ManagersHalf   *ManagersHalf table*

Description

Split season data for managers

Usage

```
data(ManagersHalf)
```

Format

A data frame with 93 observations on the following 10 variables.

playerID Manager (player) ID code

yearID Year

teamID Team; a factor

lgID League; a factor with levels AL NL

inseason Managerial order. One if the individual managed the team the entire year. Otherwise denotes where the manager appeared in the managerial order (1 for first manager, 2 for second, etc.). A factor with levels 1 2 3 4 5

half First or second half of season

G Games managed

W Wins

L Losses

rank Team's position in standings for the half

Source

Lahman, S. (2024) Lahman's Baseball Database, 1871-2023, 2024 version, <http://www.seanlahman.com/>

Examples

```
library("dplyr")
library("reshape2")

# Only have data for 1892 and 1981

# League rank by half for 1981 teams with the same
# manager in both halves who were hired in-season
ManagersHalf %>%
  filter(yearID >= 1901) %>%
  group_by(teamID, yearID) %>%
  filter(all(playerID == playerID[1])) %>%  # same manager in both halves
  mutate(winPct = round(W/G, 3)) %>%
  reshape2::dcast(playerID + yearID + teamID + lgID ~ half,
                  value.var = "rank") %>%
  rename(rank1 = `1`, rank2 = `2`)
```

Parks *Parks table*

Description

Name and location data for baseball stadiums.

Usage

```
data(Parks)
```

Format

A data frame with 260 observations on the following 6 variables.

park.key unique identifier for each ballpark

park.name the name of the ballpark

park.alias a semicolon delimited list of other names for the ballpark if they exist

city city where the ballpark is located

state state where the ballpark is located

country country where the ballpark is located

Details

This dataset apparently includes all ballparks that were ever used in baseball. There is no indication of the years they were used, nor the teams that played there.

The ballparks can be associated with teams through the park variable in the Teams table.

Source

Lahman, S. (2024) Lahman's Baseball Database, 1871-2023, 2023 version, `http://www.seanlahman.com/`

`Teams`

Examples

```
data(Parks)
library(dplyr)
# how many parks in each country?
table(Parks$country)

# how many parks in each US state?
Parks %>%
  filter(country=="US") %>%
  count(state, sort=TRUE)

# ballparks in NYC
Parks %>%
  filter(state=="NY") %>%
  filter(city %in% c("New York", "Brooklyn", "Queens"))

# ballparks in Canada
Parks %>%
  filter(country=="CA") %>%
  count(state, sort=TRUE)

# what are the Canadian parks?
Parks %>%
  dplyr::filter(country=="CA")
```

People   *People table*

Description

People table - Player names, DOB, and biographical info. This file is to be used to get details about players listed in the `Batting`, `Pitching`, and other files where players are identified only by `playerID`.

Usage

```
data(People)
```

Format

A data frame with 21010 observations on the following 26 variables.

playerID A unique code assigned to each player. The playerID links the data in this file with records on players in the other files.

birthYear Year player was born

birthMonth Month player was born

birthDay Day player was born

birthCountry Country where player was born

birthState State where player was born

birthCity City where player was born

deathYear Year player died

deathMonth Month player died

deathDay Day player died

deathCountry Country where player died

deathState State where player died

deathCity City where player died

nameFirst Player's first name

nameLast Player's last name

nameGiven Player's given name (typically first and middle)

weight Player's weight in pounds

height Player's height in inches

bats a factor: Player's batting hand (left (L), right (R), or both (B))

throws a factor: Player's throwing hand (left(L) or right(R))

debut Date that player made first major league appearance

finalGame Date that player made first major league appearance (blank if still active)

retroID ID used by retrosheet, https://www.retrosheet.org/

bbrefID ID used by Baseball Reference website, https://www.baseball-reference.com/

birthDate Player's birthdate, in as.Date format

deathDate Player's deathdate, in as.Date format

Details

debut, finalGame were converted from character strings with as.Date.

playerInfo   *Lookup Information for Players and Teams*

Description

These functions use grep to lookup information about players (from the People file) and teams (from the Teams file).

Usage

```
playerInfo(playerID, nameFirst, nameLast, data = Lahman::People, extra = NULL, ...)

teamInfo(teamID, name, data = Lahman::Teams, extra = NULL, ...)
```

Arguments

playerID	pattern for playerID
nameFirst	pattern for first name
nameLast	pattern for last name
data	The name of the dataset to search
extra	A character vector of other fields to include in the result
...	other arguments passed to grep
teamID	pattern for teamID
name	pattern for team name

Value

Returns a data frame for unique matching rows from data

Author(s)

Michael Friendly

Lahman, S. (2024) Lahman's Baseball Database, 1871-2023, 2024 version, http://www.seanlahman.com/

Examples

```
require("dplyr")

# How many different schools are listed in each state?
table(Schools$state)

# How many different schools are listed in each country?
table(Schools$country)

# Top 20 schools
schoolInfo <- Schools %>% select(-country)

schoolCount <- CollegePlaying %>%
                group_by(schoolID) %>%
                summarise(players = length(schoolID)) %>%
                left_join(schoolInfo, by = "schoolID") %>%
                arrange(desc(players))
head(schoolCount, 20)

# sum counts by state
schoolStates <- schoolCount %>%
                group_by(state) %>%
                summarise(players = sum(players),
                            schools = length(state))
str(schoolStates)
summary(schoolStates)
```

SeriesPost   *SeriesPost table*

Description

Post season series information

Usage

```
data(SeriesPost)
```

Format

A data frame with 389 observations on the following 9 variables.

yearID Year

round Level of playoffs

teamIDwinner Team ID of the team that won the series; a factor

lgIDwinner League ID of the team that won the series; a factor with levels AL NL

teamIDloser Team ID of the team that lost the series; a factor

lgIDloser League ID of the team that lost the series; a factor with levels AL NL

wins Wins by team that won the series

losses Losses by team that won the series

ties Tie games

Source

Lahman, S. (2024) Lahman's Baseball Database, 1871-2023, 2024 version, http://www.seanlahman.com/

Examples

```
data(SeriesPost)

# How many times has each team won the World Series?

# Notes:
# - the SeriesPost table includes an identifier for the
# team (teamID), but not the franchise (e.g. the Brooklyn Dodgers
# [BRO] and Los Angeles Dodgers [LAN] are counted separately)
#
# - the World Series was first played in 1903, but the
# Lahman data tables have the final round of the earlier
# playoffs labelled "WS", so it is necessary to
# filter the SeriesPost table to exclude years prior to 1903.

# using the dplyr data manipulation package
library("dplyr")
library("tidyr")
library("ggplot2")

## WS winners, arranged in descending order of titles won
ws_winner_table <- SeriesPost %>%
  filter(yearID > "1902", round == "WS") %>%
  group_by(teamIDwinner) %>%
  summarise(wincount = n()) %>%
  arrange(desc(wincount))
ws_winner_table

## Expanded form of World Series team data in modern era

ws <- SeriesPost %>%
      filter(yearID >= 1903 & round == "WS") %>%
      select(-ties, -round) %>%
      mutate(lgIDloser = droplevels(lgIDloser),
             lgIDwinner = droplevels(lgIDwinner))
```

```
# Bar chart of length of series (# games played)
# 1903, 1919 and 1921 had eight games
ggplot(ws, aes(x = wins + losses)) +
  geom_bar(fill = "dodgerblue") +
  labs(x = "Number of games", y = "Frequency")

# Last year the Cubs appeared in the WS
ws %>%
  filter(teamIDwinner == "CHN" | teamIDloser == "CHN") %>%
  summarise(max(yearID))

# Dot chart of number of WS appearances by teamID
ws %>%

```

Teams   *Teams table*

Description

Yearly statistics and standings for teams

Usage

```
data(Teams)
```

Format

A data frame with 3045 observations on the following 48 variables.

yearID Year

lgID League; a factor with levels AA AL FL NL PL UA

teamID Team; a factor

franchID Franchise (links to [TeamsFranchises](#) table)

divID Team's division; a factor with levels C E W

Rank Position in final standings

G Games played

Ghome Games played at home

W Wins

L Losses

DivWin Division Winner (Y or N)

WCWin Wild Card Winner (Y or N)

LgWin League Champion(Y or N)

WSWin World Series Winner (Y or N)

R Runs scored

AB At bats

H Hits by batters

X2B Doubles

X3B Triples

HR Homeruns by batters

BB Walks by batters

SO Strikeouts by batters

SB Stolen bases

CS Caught stealing

HBP Batters hit by pitch

SF Sacrifice flies

RA Opponents runs scored

ER Earned runs allowed

ERA Earned run average

CG Complete games

SHO Shutouts

SV Saves

IPouts Outs Pitched (innings pitched x 3)

HA Hits allowed

HRA Homeruns allowed

BBA Walks allowed

SOA Strikeouts by pitchers

E Errors

DP Double Plays

FP Fielding percentage

name Team's full name

park Name of team's home ballpark

attendance Home attendance total

BPF Three-year park factor for batters

PPF Three-year park factor for pitchers

teamIDBR Team ID used by Baseball Reference website

teamIDlahman45 Team ID used in Lahman database version 4.5

teamIDretro Team ID used by Retrosheet

Details

Variables X2B and X3B are named 2B and 3B in the original database

TeamsFranchises   *TeamFranchises table*

Description

Information about team franchises

Usage

```
data(TeamsFranchises)
```

Format

A data frame with 120 observations on the following 4 variables.

franchID Franchise ID; a factor

franchName Franchise name

active Whether team is currently active (Y or N)

NAassoc ID of National Association team franchise played as

Source

Lahman, S. (2024) Lahman's Baseball Database, 1871-2023, 2024 version, http://www.seanlahman.com/

Examples

```
data(TeamsFranchises)

# Which of the active Major League Baseball teams had a National Association predecessor?

# Notes:
# - the National Association was founded in 1871, and continued through the
# 1875 season. In 1876, six clubs from the National Association and two other
# independent clubs formed the National League, which exists to this day.
# - the `active` field has "NA" for the National Association franchises
# - where appropriate, the `NAassoc` field has the `franchID` of the successor National League team

# using the dplyr data manipulation package
library("dplyr")

NatAssoc_active_table <- TeamsFranchises %>%
  filter(active == "Y") %>%
  filter(!is.na(NAassoc))
NatAssoc_active_table

# Merge current team IDs with franchise IDs
currentTeams <- Teams %>%
                filter(yearID == 2014) %>%
```

```
                     select(teamID, franchID, lgID, park)

# Merge TeamsFranchises with currentTeams
TeamsFranchises %>%
